Abstract

This is Volume 3 of a series of lessons containing the training material for Release 5B of the Earth Observing System Data and Information System (EOSDIS) Core System (EOS). This lesson provides a detailed description of the process required for submitting and updating trouble tickets as well as investigating problems and identifying and implementing solutions.

Keywords: training, instructional design, course objective, problem management, trouble ticket, trouble ticket review board, Trouble Ticket Telecon, Remedy.

Introduction

Identification

Training Material Volume 3 is part of Contract Data Requirements List (CDRL) Item 129, whose requirements are specified in Data Item Description (DID) 625/OP3 and is a required deliverable under the Earth Observing System Data and Information System (EOSDIS) Core System (ECS), Contract (NAS5-60000).

Scope

Training Material Volume 3 describes the process and procedures by which trouble tickets are submitted and updated. In addition, the lesson describes in general terms the processes by which problems submitted on trouble tickets are investigated and solutions are identified and implemented. This lesson is designed to provide the operations staff with sufficient knowledge and information to satisfy all lesson objectives.

Purpose

The purpose of this Student Guide is to provide a detailed course of instruction that forms the basis for understanding problem management. Lesson objectives are developed and will be used to guide the flow of instruction for this lesson. The lesson objectives will serve as the basis for verifying that all lesson topics are contained within this Student Guide and slide presentation material.

Status and Schedule

This lesson module provides detailed information about training for Release 5B. Subsequent revisions will be submitted as needed.

Organization

This document is organized as follows:

Introduction: The Introduction presents the document identification, scope, purpose, and organization.

Related Documentation: Related Documentation identifies parent, applicable and information documents associated with this document.

Student Guide: The Student Guide identifies the core elements of this lesson. All Lesson Objectives and associated topics are included.

Slide Presentation: Slide Presentation is reserved for all slides used by the instructor during the presentation of this lesson.
Related Documentation

Parent Document
The parent document is the document from which this ECS Training Material’s scope and content are derived.

423-41-01  Goddard Space Flight Center, EOSDIS Core System (ECS) Statement of Work

Applicable Documents
The following documents are referenced within this ECS Training Material, or are directly applicable, or contain policies or other directive matters that are binding upon the content of this document:

Lesson Overview

This lesson will provide you with the complete process by which trouble tickets are submitted and updated. In addition, the lesson describes in general terms the processes by which problems submitted on trouble tickets are investigated and solutions are identified and implemented.

Lesson Objectives

Overall Objective - The overall objective of the Problem Management lesson is for Science and Communications Maintenance and Operations (M&O) personnel to develop proficiency in the procedures that apply to the trouble ticketing/problem resolution process for the Earth Observing System (EOS) Data and Information System (EOSDIS) Core System (ECS).

Condition - The student will be given a written description of an operational problem (affecting ECS hardware, software, documentation, or procedures), access to the Trouble Ticketing System, a copy of 609-CD-510-002, Release 5B Operations Tools Manual, and a copy of 611-CD-510-001, Mission Operation Procedures for the ECS Project.

Standard - The student will use the Trouble Ticketing System without error in accordance with the prescribed process and procedures to submit, update and complete the specified parts of a trouble ticket.

Specific Objective 1 - The student will perform the steps involved in submitting a trouble ticket.

Condition - The student will be given a description of an operational problem to be reported through the Trouble Ticketing System, access to the Trouble Ticketing System (through a workstation or terminal), a copy of 609-CD-510-002, Release 5B Operations Tools Manual, and a copy of 611-CD-510-001, Mission Operation Procedures for the ECS Project.

Standard - The student will perform without error the steps involved in submitting a trouble ticket in accordance with the applicable procedure.

Specific Objective 2 - The student will perform the steps involved in making a change to an existing trouble ticket.

Condition - The student will be given a description of a change to be made to an existing trouble ticket, access to the Trouble Ticketing System (through a workstation or terminal), a copy of 609-CD-510-002, Release 5B Operations Tools Manual, and a copy of 611-CD-510-001, Mission Operation Procedures for the ECS Project.

Standard - The student will perform without error the steps involved in making a change to an existing trouble ticket in accordance with the applicable procedure.
Specific Objective 3 - The student will describe the general steps in the routine trouble ticket problem resolution process, including the differences that result from assignment of the various priority levels.

Standard - The student will state without error the general steps involved in the routine trouble ticket problem resolution process in accordance with the applicable procedure.

Specific Objective 4 - The student will describe the general steps in the process of preparing a Trouble Ticket Telecon and processing a trouble ticket through the problem resolution process.

Standard - The student will state without error the general steps involved in the processing of an operational problem through the problem resolution process in accordance with the applicable procedure.

Specific Objective 5 - The student will describe the general steps in the process of making emergency fixes to operational problems.

Standard - The student will state without error the general steps involved in making an emergency fix of an operational problem in accordance with the applicable procedure.

**Importance**

This lesson applies to students who will be internal users or operators of the ECS (including support staff). The lesson will provide them with the knowledge and skills needed for submitting trouble tickets and making additional entries on trouble tickets in the course of investigating ECS problems reported on trouble tickets. They will need the knowledge and skills on the job when they encounter ECS hardware, software, documentation or procedural problems that they cannot readily fix, that affect other users/operators, or that are system-wide problems. The lesson describes why and how trouble tickets are submitted and updated. In addition, it describes in general terms the processes by which problems submitted on trouble tickets are investigated and solutions are identified and implemented. Consequently, the students will become aware of what happens to the trouble tickets they submit and what they can expect in terms of feedback on their submittals.
Writing a Trouble Ticket (TT)

Purpose and Functions of Trouble Tickets

A trouble ticket (TT) is an electronic document that serves the following purposes:

- reporting/recording problems.
- recording an idea for a system enhancement.

The problems reported most frequently affect the following ECS components:

- hardware.
- software.
- technical documents.
- procedures.

Trouble tickets that are used for recording an idea for a system enhancement are considered by the Sustaining Engineering organizations either at the Distributed Active Archive Centers (DAACs) or at the ECS Sustaining Engineering Organization (SEO).

Trouble tickets are submitted by:

- users in the science community.
- ECS operators.
- developers using ECS.

Trouble tickets have several possible states:

- New.
- Assigned.
- Solution Proposed.
- Implement Solution.
- Solution Implemented.
- Closed.
- Forwarded.
- Work Around.
- Not Repeatable.

A trouble ticket is “open” (in process) until the problem has been resolved and the problem resolution has been officially approved. Then the trouble ticket is “closed.”
Problems which require changes that could have significant effects on the ECS configuration must be referred to the configuration management process. If the TT investigation indicates that a configuration change is required to solve a problem or to develop an enhancement, the subject of the TT becomes a configuration management issue and a Configuration Change Request (CCR) is prepared.

- A CCR provides documentation of the configuration management process by which changes to ECS configuration items (CI) or configuration controlled items (i.e., components of CI) are approved and implemented.
- A trouble ticket leads to a CCR only when a configuration change is proposed.

The ECS Trouble Ticketing System provides a consistent means of...

- reporting ECS problems.
- classifying problems.
- tracking the occurrence and resolution of problems.

The Trouble Ticketing System is managed by a computer software package called Remedy. Remedy’s Action Request System provides a distributed Trouble Ticketing System that furnishes ECS centers (e.g., System Monitoring and Coordination Center (SMC), DAACs) with a common means of classifying, tracking, and reporting both the occurrence of problems and their resolution to ECS users and operations personnel. The Trouble Ticketing System performs the following functions:

- Provides a graphical user interface (GUI) that provides operations personnel with access to all trouble ticketing systems.
- Provides a common trouble ticket entry format.
- Stores trouble tickets.
- Retrieves trouble tickets upon request.
- Allows operations personnel to forward problem reports from one ECS center to another.
- Produces stock and common reports on ECS problems.
- Provides interfaces with users’ and operators’ e-mail to provide automatic notification of events that affect a trouble ticket (such as logging in of a newly submitted trouble ticket or “close-out” (completion) of a trouble ticket).
- Offers an application programming interface through which ECS computer programs can automatically submit trouble tickets.
- Provides summary information to the SMC from each DAAC to allow SMC personnel to prepare trend reports on ECS problems.
- Defines a consistent “life cycle” (from submittal to completion) for trouble tickets.
• Allows each ECS center to customize trouble ticket escalation and action rules.
  – Escalation rules are time-activated events.
  – When a trouble ticket meets whatever conditions are specified in the rules, the Trouble Ticketing System takes the designated action. For example:
    • notification (of either a user or support staff member).
    • writing to a log file.
    • setting a field value on the trouble ticket.
    • running a custom-written process.

In addition to the functions performed by Remedy’s Action Request System, the Trouble Ticketing System provides other methods of submitting and/or keeping track of trouble ticket status.

• set of custom hypertext markup language (HTML) documents.
  – allow registered users to submit new trouble tickets and determine the current status of any of their previous trouble ticket entries via the Internet.

• text e-mail template.
  – allows automated entry of trouble ticket information.

• contacting a User Services representative at one of the DAACs.
  – by telephone.
  – in person.

In addition to tracking trouble tickets, the Remedy Action Request System provides a User Contact Log for User Services representatives.

• There is a separate schema (GUI) that accepts the entries which User Services personnel enter for each contact they have with ECS users.

• A button on the User Contact Log schema allows the User Services representative to automatically fill out a new trouble ticket simply by clicking on the button.
  – Clicking the button transfers data from the contact log to the appropriate fields on a trouble ticket form.

Writing/Submitting Trouble Tickets

The particular method that a person who is submitting a trouble ticket uses depends on whether the person submitting the trouble ticket is an internal or external user of ECS.

• External users submit trouble tickets either through the HTML documents, e-mail template, or by contacting User Services.
Internal operators and users of ECS submit trouble tickets using the Remedy Action Request System.

Because this course is intended for ECS personnel, only the internal method (using Remedy) is described in this lesson.

The Trouble Ticketing System is wholly automated.

- TTs are handled electronically.
  - Common distributed-access database system.
  - Remedy is the database tool.

- Supporting documentation for a trouble ticket must be handled separately.
  - It is not possible to attach a file in Remedy.
  - Supporting documentation in electronic form (e.g., computer files) must be sent to the local Trouble Ticketing System database administrator. (Attach an e-mail message identifying the corresponding trouble ticket number, submitter identification and any other relevant information.)
  - Trouble Ticketing System database administrators:
    - SMC Configuration Management (CM) Administrator
    - SEO Operations Readiness and Performance Assurance Analyst
    - DAAC Operations Readiness and Performance Assurance Analyst
  - Supporting documentation not in electronic form (if any) is handled by the local Trouble Ticketing System database administrator and is listed as an attachment to the trouble ticket.

The procedure for writing and submitting a trouble ticket is performed by any internal ECS user or operator who needs to submit a trouble ticket to have an operating problem investigated. The procedure starts with the assumption that the user or operator has logged in to ECS and the proper desktop environment is being displayed.

Access to Remedy is gained through the use of UNIX commands. Launching Remedy starts with the assumption that the applicable servers are running and the operator has logged in to the ECS system.
Launching Remedy Using UNIX Commands

1  Access the command shell.
   •  The command shell prompt is displayed.

   **NOTE:**  Commands in Steps 2 through 8 are typed at a UNIX system prompt.

3  Type `setenv DISPLAY clientname:0.0` then press the **Return/Enter** key.
   •  Use either the terminal/workstation IP address or the machine-name for the `clientname`.

4  Start the log-in to the MSS client server by typing either `/tools/bin/ssh hostname` (e.g., `g0msh08`) and then press the **Return/Enter** key.
   •  If you receive the message, **Host key not found from the list of known hosts. Are you sure you want to continue connecting (yes/no)?**  type yes (“y” alone does not work) and then press the **Return/Enter** key.
   •  If you have previously set up a secure shell passphrase and executed `sshremote`, a prompt to **Enter passphrase for RSA key '<user@localhost>'** appears; continue with Step 5.
   •  If you have not previously set up a secure shell passphrase; go to Step 6.

5  If a prompt to **Enter passphrase for RSA key '<user@localhost>'** appears, type your **Passphrase** and then press the **Return/Enter** key. Go to Step 7.

6  At the `<user@remotehost>'s password:` prompt, type your **Password** and then press the **Return/Enter** key.

7  Type `cd /path` then press the **Return/Enter** key.
   •  Change directory to the directory (e.g., `/usr/ecs/mode/COTS/remedy/bin`) containing the Remedy command files.
   •  The **mode** will most likely be one of the following operating modes:
      –  OPS (for normal operation).
      –  TS1 (for testing).
      –  SHARED (for other uses).
   •  Note that the separate subdirectories under `/usr/ecs` apply to different operating modes.

8  Type `aruser &` then press **Return/Enter**.
   •  The Remedy Action Request System Main User Tool window appears on the screen.
The basic steps of the procedure for writing a trouble ticket are as follows (the sequence of Steps 4 - 6 is not critical):

**Writing a Trouble Ticket**

1. If the schema in the Action Request System window is anything other than the **RelB-Trouble Tickets** schema (Figure 1), select **File→Open Schema** from the pull-down menu and select the **RelB-Trouble Tickets** schema.
   
   - The **Open Schema** window (Figure 2) appears.

[Image of the Action Request System window showing various fields such as Ticket Status, Assigned-To, Ticket Details, and other related fields.]

**Figure 1. Release B Trouble Tickets Schema**
Click on **RelB-Trouble Tickets** in the **Open Schema** list of schemas to highlight it.

3. Click on the **Apply** button in the lower left-hand corner of the **Open Schema** dialog box.
   - The **RelB-Trouble Tickets** schema (Figure 1) is displayed.
     - Allows operations personnel access to TTs for purposes of submitting, reviewing, or modifying them.

4. Select **File → Open Submit** from the pull-down menu.
   - The **Submit** GUI (Figure 3) is displayed.
   - **Submit** resembles the **RelB-Trouble Tickets** schema except for an **Apply** button in the lower left-hand corner and a **Dismiss** button in the lower right-hand corner.
Type a short description of the problem (up to 128 characters) in the **Short Description** field.

- **Short Description** is a mandatory entry.
- The **Short Description** field and some other fields have a document icon associated with them so you can click on the icon and open a window in which you can type information at length.
6 Place the mouse cursor on the **Submitter ID** pick-list icon. Press the left mouse button and move the cursor down the list until your ID is highlighted; then release the mouse button to transfer your ID into the **Submitter ID** field.

- Remedy will automatically fill in the following fields when you actually submit the TT:
  - Submitter Name.
  - Submitter Phone [number].
  - Submitter eMail [address].
  - Submitter Home DAAC.

- If your name is not on the pick-list, you must type the information in all of the preceding fields.

- If you have any questions concerning what should be entered in any of the identification fields, ask the Trouble Ticketing System database administrator.

7 Click and **hold** on the **Submitter Impact** option button to display a menu of “impacts.”

- The following menu of impact codes is displayed:
  - High.
  - Medium.
  - Low.

- **Submitter Impact** is an optional field.

- Default value (Low) is set automatically if you do not make a selection in this field.

8 Select the desired impact code by moving the cursor to the desired code in the menu to highlight it, then release the mouse button.

- Selected code is displayed on the **Submitter Impact** option button.

9 Fill in any of the following optional fields which provide useful information for the problem investigation:

- **Long Description** (description of the problem using up to 255 characters).

- **Software Resource** (software with which the problem originated).

- **Hardware Resource** (hardware from which the problem came).
10 When you are satisfied that the information in the trouble ticket fields is correct, click on the Apply button in the lower left-hand corner of the Submit GUI to submit the TT.
   • TT is entered into the Remedy database.
   • A message should appear at the bottom center of the form notifying you that the TT has been successfully submitted.
     – Trouble ticket identification number is included in the message.
   • Remedy will send you an e-mail message to confirm that the trouble ticket has been entered into the database.
     – If you do not receive confirmation, you should contact the Trouble Ticketing System database administrator.

11 To exit from the Remedy Action Request System first click on the Dismiss button in the lower right-hand corner of the Submit GUI.

12 Select File→Exit from the pull-down menu.

13 If it is necessary to provide back-up information/documentation, such as a file that illustrates the problem, send the documentation to the Trouble Ticketing System database administrator.
   • Send an e-mail cover message that contains the following information:
     – Trouble ticket number (Ticket-Id).
     – Submitter ID.
     – Relevant information concerning the attachment.
Documenting Changes

Reviewing and Modifying Trouble Tickets

Trouble tickets must be modified as the problem resolution process progresses and the various parties involved in the process have to make entries on the trouble ticket, for example:

- assignment to a technician for problem resolution.
- resolution log entries.
- changes of status.
- forwarding to another site.

The changes are the result of better understanding of the nature of problems, proposed and revised solutions resulting from the investigation, or Trouble Ticket Review Board decisions.

Access to trouble ticket data is controlled by the database administrator for the Trouble Ticketing System. The database administrator assigns each user of Remedy’s Action Request System certain access privileges.

- Access privileges determine which trouble ticket fields (if any) you can modify.
- Examples:
  - Some operators will be allowed only permission to submit TTs.
  - Operations Supervisor must be able to submit TTs, modify ticket status, assign priority, assign the TT to a specific investigator, and make many other modifications.

The basic steps of the procedure for reviewing or modifying TTs through Remedy are as follows:

**Reviewing and Modifying Open Trouble Tickets**

1. Access the Remedy User Tool by performing the Launching Remedy Using UNIX procedure defined earlier in this lesson.

   - The Remedy Action Request System Main User Tool window appears on the screen.
   - Either the last schema that was open or a blank RelB-Trouble Tickets schema (Figure 1) is displayed.
If the schema in the Action Request System window is anything other than the **RelB-Trouble Tickets** schema (Figure 1), select **File→Open Schema** from the pull-down menu.

- The **Open Schema** window (Figure 2) appears.

3. Select (highlight) **RelB-Trouble Tickets** from the **Open Schema** list of schemas.

4. Click on the **Apply** button in the lower left-hand corner of the **Open Schema** dialog box.

- The **RelB-Trouble Tickets** schema (Figure 1) is displayed.

5. If the trouble ticket to be modified has some characteristic that will allow you to restrict the system’s querying of the database, enter the data in either the corresponding field on the **RelB Trouble Tickets** schema or in the **Query** field at the bottom of the form.

- For example, you may restrict querying to only those trouble tickets that have a high assigned priority and have been submitted within the last three days.

6. Follow menu path **Query→List**.

- The **Query List** dialog box (Figure 4) is displayed.

  - contains a list of trouble tickets.

![Figure 4. Query List Dialog Box](image)
Select (highlight) the specific trouble ticket(s) that you would like to review/modify.

In the Query List dialog box, follow menu path Query→Modify Individual.

- Use Modify All Selected (rather than Modify Individual) only if you wish to make exactly the same changes to a group of highlighted TTs.
- The Modify Individual GUI is displayed.
  - resembles the RelB-Trouble Tickets schema except for an Apply button in the lower left-hand corner and a Dismiss button in the lower right-hand corner
  - current trouble ticket data appears in the fields on the trouble ticket form.

Review and/or modify the trouble ticket fields as necessary.

- The fields are described in Table 1 (extracted from 609-CD-510-002, Release 5B Operations Tools Manual.)
- Some of the fields (e.g., Submitter ID, Assigned-To, Closing Code) have pick-list icons associated with them so you can click on the pick-list icon and highlight the text to be entered in the field.
- Some of the fields (e.g., Detailed Resolution Log, History) have diary or document icons so you can open a window in which you can type information at length.

If you wish to forward the TT to another ECS center, you must first click on the Ticket Status option button and select Forwarded from the option menu.

- You must be authorized to forward TTs.

When forwarding a TT to another ECS center, select the TT’s destination using the Forward-to field pick list then click on the Forward button.

- Be sure to go to the next step (applying the change) or there will be no local record that the TT was forwarded.
- If you forward a TT to another center, it will receive a new Ticket-Id at that center and the original identifier will be transferred to the Unique-Identifier field.
- The TT will retain its original Ticket-Id at your center.

When you are satisfied that the information in the trouble ticket fields is correct, click on the Apply button to make the changes effective.

To exit from the Remedy Action Request System first click on the Dismiss button in the lower right-hand corner of the Modify Individual GUI.

Select File→Exit from the pull-down menu.

</tbody>
</table>

In addition to the fields described in the preceding table, the RelB-Trouble Tickets schema provides the following active links:

- **Forward**—Forwards the trouble ticket to the site specified in the **Forward-to** field (Ticket Status field must be set at **Forwarded**).

- **Hardware Information**—Opens a window that is associated with the trouble ticket to hold hardware information.

- **List All Masters**—All trouble tickets that are duplicates of each other have one master. This button lists all master trouble tickets.

- **List This TT’s Duplicate(s)** -- List all trouble tickets that are duplicates associated with this trouble ticket.

- **Go to Contact Log** -- If the trouble ticket was created from a contact log (User Services), then this button opens a window to that contact log.
This page intentionally left blank.
Problem Resolution

Overview of Problem Resolution

- Every trouble ticket (TT) is logged into the Remedy database for record-keeping purposes.
- Each TT is evaluated first at the local center to determine the severity of the problem and to assign on-site responsibility for investigating the problem.
- TTs that can be resolved locally are assigned and tracked at the local center.
- System-level problems and/or those that cannot be resolved locally are escalated to the agenda of the trouble ticket teleconference (known as the “TT Telecon”) for discussion and disposition.
  - sponsored by the Maintenance & Operations (M&O) organization.
  - held daily.
  - functions as the problem review forum for ECS failures/malfunctions.
  - participants discuss TTs referred from the sites to the System Monitoring and Coordination Center (SMC) and coordinate TT activities within the M&O organization as well as with development, customer, and user organizations.

The TT Telecon review processes are the principal topics of a separate section of this lesson.

Trouble Ticket Triage

The Operations Supervisor at each center assigns ratings to trouble tickets based on perceived impact. The TT Telecon subsequently assigns ratings using a triage system of maintenance priorities. The triage system is based on the degree to which a problem will adversely affect mission success. The following factors are considered:

- Scope of the problem’s effects (impact).
- Frequency of occurrence.
- Availability of an adequate work-around.

When initially submitted, problems are classified by the submitter into one of three categories based on perceived impact: high, medium, or low. Review by the TT Telecon results in assignment to one of three priority categories: high, medium, or low, in the context of other submitted trouble tickets, assessed severity, availability of workaround, and consequences of the problem. These priority categories are approximately equivalent to categories specified in the Performance Assurance Requirements document [EOS Performance Assurance Requirements for...
Table 2 shows the categories identified in the Performance Assurance Requirements and specific definitions applied by M&O and the TT Telecon to assign priorities. The table also illustrates that M&O may further characterize low priority problems with additional classifications, as the problems are converted to non-conformance reports (NCRs) for resolution by the Sustaining Engineering Organization (SEO).

**Table 2. Trouble Ticket Priorities**

<table>
<thead>
<tr>
<th>Category 1: System/Service cannot perform critical function or imposes major safety hazard. (Priority 1)</th>
<th>HIGH (Priority 1): An NCR for which no workaround exists or an NCR for which no workaround can be accommodated by DAAC operators given a detailed workaround procedure is documented but the procedure is inadequate based upon the complexity of the procedure, the abilities of an adequately trained and experienced operator, or both; and the consequence of the occurrence causes:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Presents an immediate impact to development, operations, services, or data processing functions; imposes major safety hazard to personnel, systems, or space mission resources; or results in loss of one or more essential mission objectives.</td>
<td>- the unrecoverable loss of data,</td>
</tr>
<tr>
<td></td>
<td>- the system to be unable to ingest, process, or distribute data,</td>
</tr>
<tr>
<td></td>
<td>- the system to be unable to support user searches for available data, or</td>
</tr>
<tr>
<td></td>
<td>- the operator to be unable to startup, shutdown or determine the status of system components.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Category 2: System/Service substantially impaired. (Priority 2)</th>
<th>MEDIUM (Priority 2): An NCR for which a workaround exists but the frequency of occurrence is expected to be more than approximately once per day, the occurrence cannot be anticipated, and the impact is such that system performance is degraded to a point that there is reasonable risk that 24 hours of work cannot be accommodated within a 24 hour period.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Substantially impacts development, operations, services, or data processing functions; fails to operate within critical performance specifications; or cannot effectively or efficiently fulfill baseline requirements.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Category 3: System/Service slightly impaired. (Priority 3)</th>
<th>Priority 3: Every other kind of problem (System/Service slightly impaired).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Causes minor or no substantial impact to development, operations, services, or data processing functions. Support may be degraded, but mission can still be accomplished.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Priority 4: Improvement (Nuisance; e.g., a typo).</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Priority 5: Enhancement (Identified for next release).</td>
<td></td>
</tr>
</tbody>
</table>

Any problem report that meets the conditions of Category 1 is designated a “**Red Flag**” report. According to the performance assurance requirements, malfunctions most likely to be assigned Category-1 status are “those involving the command and control functions of the FOS or those that can result in inability to produce, or irretrievable loss of Essential Data Products.”
Trouble Ticket Review Board

Each site establishes its own TT Review Board (TTRB). The TTRB considers the problem and proposed solution for each TT that is referred to it.

- TTRB reviews/approves priorities that are assigned locally by the Operations Supervisor based on perceived impact.
- The TT tool (Remedy) uses the priority codes high, medium, and low.
  - Priorities are maintained by the Configuration Management (CM) Administrator.
- The TT Review Board may suggest, comment, reject, approve or otherwise recommend actions as the board deems appropriate (within the limits of its authority).
- All high priority trouble tickets are referred to SMC and ultimately to the TT Telecon.
- Problems that are assigned a medium priority rating are usually resolved by the local TTRB.
  - resolution may be brought to the attention of the TT Telecon for “advice and acknowledgment.”
- Medium- and low-priority trouble tickets can often be handled locally unless they affect more than one site.
- Problems that affect multiple sites are forwarded to the SMC.
- If the resolution of a TT entails a system enhancement and therefore involves a configuration change (as determined by the board), the TT Review Board generates a Configuration Change Request (CCR).
  - problem (CCR) is entered into the Change Request Manager (Distributed Defect Tracking System—DDTS) and is directed through the configuration management process, including review by the Configuration Control Board.
- For a TT forwarded to SMC and the TT Telecon, if resolution results in correction of a system non-conformance, it is likely to become part of a software patch.
- If the resolution of a TT does not involve a configuration change and can be handled locally, the TT Review Board issues implementing instructions.
- After the problem has been corrected and the fix has been verified through testing, the TT Review Board orders the TT database administrator to close the trouble ticket.

TT Telecon

As previously mentioned, the TT Telecon serves as the forum for ECS failures or malfunctions. It has the following primary functions:

- review all TTs.
- acknowledge the TTRB’s response to medium-priority problems.
- coordinate TT activities within M&O and with development, customer and user organizations.

This lesson includes a separate section on processing trouble tickets through the TT Telecon.

**Problem Resolution Process**

The steps of the general problem resolution process are based on those depicted in the Maintenance & Operations Problem Management Concept. The steps provide an outline of an average routine TT’s life cycle.

Emergency fixes of problems that would prevent operation of the ECS (especially high-priority problems) may, under some circumstances, be made through a somewhat abbreviated process. However, proper follow-up procedures must be followed to ratify the emergency action. (This lesson includes a separate section on Emergency Fixes.)

Figures 5 and 6 illustrate the general problem resolution process. The system has been configured to allow each site the flexibility to create a life cycle from this example which best fits the site’s needs. The procedural steps for making or changing entries in trouble-ticket fields are described in the Documenting Changes section of this lesson.
Problem Identified
- Operator/User
  - May be H/W, S/W, or procedural
  - User notifies User Services or Operator encounters problem

Problem Documented
- User Services/Operator/User
  - Describes problem, circumstances, ops impacts and any immediate actions on Trouble Ticket (TT) electronic form
  - Forwards to Ops Supervisor

TT Logged, Numbered
- Site CMO
  - TT assigned number and logged in TT Master Database (DB) with status “New,” administered, monitored, and reported by Site Configuration Management Office (CMO)

Trouble Ticket Assessment
- Ops Supervisor/Resource Manager
  - Reviews problem, impacts
  - Assigns Ops priority and org responsible for investigation and resolution (Fields controlled by Ops Supervisor only)
  - Changes TT status to “Assigned”
  - Forwards to assign Site Org (e.g., Ops, Maint Engr, User Services)
  - Reviews/modifies information
  - Distribution List (based on priority & problem type, auto-selected from multi-list DB)

TT DB Update
- Ops Supervisor
  - Update information to CMA TT Master DB
  - Info copies distributed automatically on and off site

All Sites Notified
- Site CMO, DAACs, EOC, EDF
  - Review, respond with pertinent information, impacts

TT DB Update
- Site CM Administrator (CMA)
  - Support TTRB (Agenda, Minutes)
  - Notify distribution of TTRB updates; update Master TT

Problem Investigation
- Assigned Site Org/Individual (PI)
  - Org assigns individual as PI (Problem Investigator); PI name and contact info transmitted to CMA for TT Master update and distribution
  - Analyzes problem to determine cause, internal/external impacts, ops workarounds, fix/resolution in consultation with vendors, developers, other orgs
  - Updates TT with analysis data and proposed resolution (e.g., system operating per design spec.; recommended enhancement is ____; proposed CCR attached)
  - Changes TT status to “Solution Proposed” and forwards to site CMA

Trouble Ticket Adjudication
  - Reviews and adjudicates, e.g.
    - Approves closure/further action assignment
    - Approves related CCR for submittal to CM process
    - Approves reassignment of action off-site
    - Site CMA closes or forwards

Configuration Mgmt
- Site CCM Administrator (CCM)
  - Site CCM - chaired by Site Mgr
    - Reviews CCR
    - Rejects or approves for site implementation and/or forwards to higher level CCM

Site Resolution
- Off-Site Actionee
  - Implements any corrective action (May be incorporated in future release)
  - Forwards correction to Site Rep for acceptance process/testing
  - Site Rep obtains approvals and resubmits to TTRB

Figure 5. ECS Problem Management Concept, Part I

Figure 6. ECS Problem Management Concept, Part II
The following procedure describes the steps of the process.

**Problem Resolution**

1. An ECS user or operator discovers a problem with ECS hardware, software, procedures, or documentation and decides to document this problem for investigation and resolution.

2. The user/operator, or, perhaps, at user request, User Services submits a TT as described in the Writing a Trouble Ticket section of this lesson.

3. The Operations Supervisor decides whether or not a rapid response is required (e.g., if there has been loss of operational capability in a critical operational period and the DAAC cannot repair the problem quickly without help).

4. In the event that rapid response is required, the Operations Supervisor calls the ECS Help Desk at 1-800-ECS-DATA; the ECS rapid response team assigns developer personnel to assist the site in solving the problem.

5. Otherwise, Remedy logs the TT into the system and assigns **New** in the **Ticket Status** field to initiate administration and monitoring by the Site Configuration Management Office (CMO).

6. The Operations Supervisor reviews the TT and assigns a priority (**High**, **Medium** or **Low**) in the TT **Assigned-Priority** field. The decision is based on the triage system of maintenance priorities. The Operations Supervisor assigns the problem to a Problem Investigator (PI) organization, and changes the TT status to “Assigned.”

7. The CM Administrator notifies all affected centers of the problem and requests their input to assist in assessing and resolving the problem.

   - There are two ways for a center to share TT information with another center.
     - forward the TT to the other center, resulting in the opening of a new TT there.
     - send the center’s TT database administrator an e-mail message containing relevant information, in which case the problem can be reviewed without being logged in to Remedy.
The TT database administrator updates the TT database with inputs concerning the problem and how to resolve it.

The Problem Investigator coordinates inputs from the Sustaining Engineering Organization (SEO), developers, vendors, and external organizations concerning how to resolve the problem at the local level. If there are significant issues to be resolved, the Problem Investigator presents them at the contractor TT Telecon sponsored by the SEO. When the Problem Investigator identifies a solution to the problem, he/she updates the TT and changes the status to Solution Proposed (Ticket Status field).

The TT Review Board (TTRB) (and the TT Telecon for Priority-1 problems) considers the proposed solution for approval, ratification, rejection, revision, closure or forwarding as applicable.

The TTRB is supported by the site Configuration Management Administrator (CMA). The CMA provides meeting support (Agenda, Minutes), and also notifies the distribution list of TTRB updates. The CMA also updates the Master TT in Remedy.

The TT Review Board decides whether the proposed change affects a configuration-controlled item and therefore needs to be referred to the CCB(s).

For a configuration issue (proposed change affects a configuration-controlled item), the site CMO distributes the Configuration Change Request (CCR) for pre-CCB review.

The CCBs may approve, reject, or revise the change proposal.

• TTRB is notified of results and reconsiders the TT accordingly.

The site CCB decides whether system-wide or external elements are involved, necessitating referral to a higher level CCB.

The Board may approve the implementation of changes that do not affect configuration-controlled items.

• If they approve the solution, they direct the CM Administrator to change the TT status to Implement Solution.
  
  – When the person assigned to correct the problem has done so, he/she changes the TT status to Solution Implemented.

• Emergency fixes can be made and then, if necessary, reported to the CCB after the crisis has been resolved.

• If the TT resolution involved temporary changes, the Maintenance Engineer updates the Baseline Manager.

The TT Review Board (TTRB) (and the TT Telecon for Priority-1 problems) considers the proposed solution for approval, ratification, rejection, revision, closure or forwarding as applicable.

The TTRB is supported by the site Configuration Management Administrator (CMA). The CMA provides meeting support (Agenda, Minutes), and also notifies the distribution list of TTRB updates. The CMA also updates the Master TT in Remedy.

The TT Review Board decides whether the proposed change affects a configuration-controlled item and therefore needs to be referred to the CCB(s).

For a configuration issue (proposed change affects a configuration-controlled item), the site CMO distributes the Configuration Change Request (CCR) for pre-CCB review.

The CCBs may approve, reject, or revise the change proposal.

• TTRB is notified of results and reconsiders the TT accordingly.

The site CCB decides whether system-wide or external elements are involved, necessitating referral to a higher level CCB.

The Board may approve the implementation of changes that do not affect configuration-controlled items.

• If they approve the solution, they direct the CM Administrator to change the TT status to Implement Solution.

  – When the person assigned to correct the problem has done so, he/she changes the TT status to Solution Implemented.

• Emergency fixes can be made and then, if necessary, reported to the CCB after the crisis has been resolved.

• If the TT resolution involved temporary changes, the Maintenance Engineer updates the Baseline Manager.
If external elements (e.g., communication networks) are involved and/or a CCR is escalated, the off-site problem resolution process is managed by the TT Telecon, which may also revise the on-site proposed solution if there are any system-level effects. This is part of the escalation process, which also includes submitting CCRs to higher level CCBs if necessary.

- If a permanent change is proposed, a Configuration Change Request (CCR) is submitted to either the on-site or system-level Configuration Control Board (CCB) as appropriate.

Off-site resolution may include corrective action incorporated in a future release.

- When the person assigned to correct the problem has done so, the TT status is changed to **Solution Implemented**.

After the solution has been implemented and the results have been verified and approved by the TT Review Board, the CM Administrator closes the TT (changes TT status to **Closed**).

**Problem Resolution Scenario**

There is a scenario in the *Release B SDPS/CSMS Operations Scenarios for the ECS Project*, 605-CD-002-001, March 1996, that illustrates the process for resolving a **routine** problem. The scenario describes the “life cycle” of a trouble ticket from the time the ticket is submitted through the process of resolving the problem.

The scenario begins when a registered ECS Science End User (the originator) discovers a significant problem and submits a trouble ticket. The scenario continues with the Operations Supervisor assigning the TT to the Maintenance Coordinator for review and analysis of the problem. Based on the analysis, a recommended solution is submitted to the TT Review Board. The TT Review Board and Chair approves the solution and directs the Maintenance Coordinator to implement the corrective action. Upon completion of the repair, the Maintenance Coordinator documents the corrective action and informs the TT Review Board for final approval and closure of the TT. The principal roles in the scenario are those of the Science End-User, the Operations Supervisor, The Maintenance Coordinator, the TT Review Board, and the ECS system.

The following steps have been extracted and adapted from the scenario to illustrate how a DAAC might handle a routine ECS problem:

1. Upon realizing that a problem exists, the End User selects a link for the Trouble Ticket process at a related network site (e.g., the EOSDIS Home Page). The TT home page is displayed on the web browser.

2. The End User selects the **Submit** option. The system software retrieves user information and populates the trouble ticket with necessary user data. The End User enters the problem impact, short descriptions, and long description, and then clicks on the **Submit** button.
3. The system creates a new TT entry in the TT System (Remedy Action Request System), displays the TT number to the user, and notifies the Operations Supervisor.
   - Rules for notification may vary from site to site (e.g., e-mail vs. Remedy notification).

4. The Operations Supervisor receives notification, selects the new TT from the Remedy Notification Tool, and the system displays the new TT.

5. Optionally, the Operations Supervisor requests reports/lists of current and past TTs to help resolve the problem. The system generates and displays the reports.

6. The Operations Supervisor selects the TT from the list and requests the system to open it.
   - The system (Remedy) opens the TT.

7. On examining the detailed information, the Operations Supervisor changes the value of Ticket Status from New to Assigned.
   - In this scenario, the Operations Supervisor can assign any status or priority to a trouble ticket.
   - In practice each site will determine who is authorized to assign TT status and priority.

8. The Operations Supervisor assigns the desired value in the Assigned-Priority field.

9. The Operations Supervisor assigns the responsibility for fixing the problem described on the trouble ticket to the Maintenance Coordinator.

10. The Operations Supervisor clicks on the Apply button to make the changes effective.
    - The system (Remedy) delivers e-mail notification of the assignment to the Maintenance Coordinator.

11. The Maintenance Coordinator receives e-mail notification of the assignment.

12. The Maintenance Coordinator makes initial entries in the Detailed Resolution Log and Resolution Log fields (which are free text diaries) indicating the proposed course of action.
    - The person who submitted the TT can review entries in the Resolution Log field.
    - The person who submitted the TT cannot review entries in the Detailed Resolution Log.

13. The Maintenance Coordinator then clicks on the Apply button to update the TT with the log data.
    - The system (Remedy) updates the TT.
14. The Maintenance Coordinator analyzes and attempts to resolve the issue that the TT addresses, updating the resolution logs (Detailed Resolution Log and Resolution Log) with pertinent information.

15. After each update to the resolution logs the Maintenance Coordinator clicks on the Apply button to order the system to make the update.
   - The system (Remedy) makes the update to the logs, including:
     - time/date.
     - name of modifier.
     - current log.

16. Upon finding a solution to the problem, the Maintenance Coordinator changes the Ticket Status to Solution Proposed.

17. The TT Review Board Chair includes the TT in a package of new Solution-Proposed TTs being compiled for review by the board.

18. The TT Review Board considers the proposed solution for the TT.
   - TT Review Board deliberations include consideration of the following questions:
     - Is the proposed solution sensible?
     - What are the long-term effects of the proposed solution?
   - The TT Review Board may suggest, comment, reject, approve or otherwise recommend actions as they deem necessary (within the limits of their authority).

19. The TT Review Board approves the proposed solution and changes the Ticket Status to Implement Solution.
   - If the TT Review Board finds that the problem presented a configuration issue, they generate a CCR.
     - Generating a CCR introduces the problem into the configuration management process.

20. The Maintenance Coordinator makes the authorized fix to the problem and changes the Ticket Status to Solution Implemented.

21. The TT Review Board approves the fix and determines appropriate entries for the TT fields Key Words, Closing Code, and Hardware Resource.
   - When the End User has verified the fix, the TT Review Board directs the TT database administrator to close the TT.
   - The database administrator makes the TT Review Board-specified entries on the TT and changes the Ticket Status to Closed.
22. The End User receives e-mail notification from the Trouble Ticketing System that the TT has been closed.
Preparing a Trouble Ticket Telecon and Processing a Trouble Ticket through the Problem Resolution Process

The SEO and the site-level maintenance organization resolve routine maintenance issues at the system level and site level, respectively. The Trouble Ticket Telecon (TT Telecon) reviews and approves priority Category-1 issues and acknowledges the TTRB’s disposition of Category-2 problems.

Trouble Ticket Telecon

NASA Category-1 and -2 TTs (see Table 2, page 26) are discussed at a TT Telecon (may be combined with a Configuration Change Request Telecon). By means of the teleconference the TT activities are coordinated within the M&O organization and with development, customer, and user organizations. Telecon attendees are listed in Figure 7.

A typical TT Telecon agenda is shown in Figure 8.

- Agenda items may be supplemented or replaced with hardcopy or softcopy reports.
- Material from the meeting is distributed within each ECS organization and to customer and user organizations as required.

Trouble Ticket Close-Out

The TT Telecon coordinates the activities of appropriate groups and personnel to ensure that the causes of all malfunctions are determined through proper investigation and analysis.

- may obtain assistance from system hardware suppliers if necessary.
- coordinates investigations and remedial actions with the appropriate project personnel from the National Aeronautics and Space Administration (NASA).
- assures proper documentation of investigations and remedial actions.
- ensures that configuration changes (if any) are made in accordance with the configuration management procedures.

The following conditions must be verified before a malfunction may be “closed out”:

- Remedial and preventive actions have been completed on the item in which the malfunction occurred.
- All necessary preventive design changes to the item have been completed and verified through testing.
- Effective preventive actions have been established to prevent problems with other affected items (if any).
- Customer representatives
- ECS M&O Manager or designee (chairs Telecon)
- DAAC representatives
- SEO engineering team leads
- ECS ILS engineering support representatives
- ECS engineering team leads and operations representatives
- ECS M&O support staff
- ECS development organization representatives

**Figure 7. TT Telecon Attendees**

- Review and prioritize each TT opened at each center
- Review and re-prioritize older TTs (as required)
- Assign TT work-off responsibility to one organization
- Review distribution of TTs by organization, priority and age
- Determine which new TTs to forward to DDTS for processing as Non-Conformance Reports (NCRs) at EDF

**Figure 8. Typical Trouble Ticket Telecon Agenda**

The TT Telecon chairman signs the close-out report before submitting it for NASA close-out. Malfunction reports are not considered “closed” until signed by the authorized Government representative.

**All “Red Flag” reports...**

- are highlighted at the Government assurance reviews (e.g., Capabilities and Requirements Reviews, Release Readiness Reviews, Segment Operational Readiness Reviews).
- must have their resolution approved by both the contractor project manager and the Government EOS Project Manager before the issue can be officially closed.
Making Emergency Fixes

The handling of emergency fixes varies with the nature of the problem and from ECS center to ECS center. There is a scenario in the *ECS Operations Concept for the ECS Project: Part 2A - ECS Release B*, 604-CD-003-002, November 1995, that illustrates the process for resolving an emergency situation involving an ECS hardware malfunction. Of course, each emergency must be dealt with individually; however, the following issues need to be decided in advance to provide a common framework for emergency responses to crisis-level situations:

- contingency plans.
- points of contact.
- general guidelines.

The hardware emergency change scenario should be considered a model process that can be used in the development of specific local procedures for making emergency fixes.

**Hardware Emergency Change Scenario**

The scenario involves the failure of hardware that requires the emergency replacement of a component that is of a later version than that contained in the baseline equipment. The problem occurs at 7:00 PM on a Saturday evening. The automated tape library (ATL) is inoperable and cannot be allowed to be out of service for the remainder of the weekend.

The following steps have been extracted and adapted from the scenario:

1. The operator has detected a problem with the automated tape library (ATL) and submits a TT. The Trouble Ticketing System records the TT and routes it to the system administrator.
2. The system administrator confirms that the system will not operate and notifies the site maintenance engineer.
3. The maintenance engineer runs further diagnostic tests to confirm the problem.
4. The maintenance engineer reports the problem and symptoms to the maintenance desk of the original equipment manufacturer (OEM). The maintenance engineer records the problem diagnosis and vendor call in the trouble ticket database.
5. The OEM maintenance representative arrives on site, verifies the symptoms, and concludes that a controller card has failed. However, the only card the OEM has immediately available is of a later version and no spares are available on site. It will be Monday at the earliest before a replacement board of the same revision level can be located.
6. The maintenance engineer reports the situation to the operations supervisor (i.e., shift leader) for a decision.

7. Because the DAAC cannot afford to have the ATL out of service until Monday, the operations supervisor calls the DAAC manager at home. The crew chief reports the situation to the DAAC manager and obtains approval to replace the defective board with the later version if tests conclude that the new one works properly.

8. The OEM’s maintenance representative installs the replacement board.

9. The site’s sustaining engineer tests the new controller board, finds that it works properly, and brings the ATL back on line.

10. The sustaining engineer generates a CCR to document the configuration change and the authority for the change.

11. The maintenance engineer records the board replacement on the TT, referencing the related CCR.

12. The maintenance engineer closes the trouble ticket.

13. The maintenance engineer updates the property record with the model, version, and serial number of the new board in the trouble ticket database.

14. The sustaining engineer records the installation in the CCR and routes the CCR to the CM administrator.

15. The CM administrator reviews the CCR and determines whether it needs to be reviewed by the site CCB.

16. The CM administrator updates the Baseline Manager with the new configuration and the number of the CCR that authorized the change.

17. The ECS SEO reviews the CCR to determine whether it has effects on the ECS system and/or other sites.

18. The Earth Science Data and Information System (ESDIS) CCB receives an information copy of the CCR for their review and concurrence.

19. The CM administrator closes the CCR when the CCB has ratified the change.

If it should later be discovered that the new version of the controller board has adverse effects when operating in the ECS configuration, it would be necessary to obtain a board of the original version to replace the newer version. The replacement of the newer-version board with an older-version board would be recorded on a new CCR that referenced the previous CCR.

**ECS Help Desk**

A Help Desk has been established at the ECS Development Facility (EDF) to provide a quick response to DAAC staffs concerning critical operational problems the DAACs may have when running ECS or performing Science Software Integration and Test (SSI&T) at their sites. The
goal is to analyze critical DAAC ECS operational problems and then marshal the necessary resources to get the DAAC system operational again as soon as possible. In meeting this goal, the Help Desk will act as the single point of ECS contact for handling all critical DAAC ECS operational problems, and will:

- assist the DAAC staffs to work through critical operational problems in the minimum time possible.
- document all critical operational problems and their fixes, or work-arounds, and make this information available to all DAACs via the SMC home page.
- train the DAAC staffs to become progressively more self-sufficient, adjusting training materials and suggesting documentation changes as needed to accomplish this.
- perform weekly trend analyses on trouble reports and report the results to ECS management.
- write Severity 1 non-conformance reports where fixes or work-arounds are not possible and the reported problem has not yet been documented.

The access to the Help Desk is by telephone at **1-800-ECS-DATA (1-800-327-3282)**.
Introduction
This exercise is intended to give the students practice in writing a trouble ticket, getting access to an existing trouble ticket and changing the information in trouble ticket data fields.

Equipment and Materials
One ECS workstation per student.

Mission Operation Procedures for the ECS Project, 611-CD-510-001, one copy per student.

Writing a Trouble Ticket
The exercise involves the writing of a trouble ticket. The exercise begins with an operator becoming aware that a network is running too slowly. The operator prepares and submits a trouble ticket.

Perform the following steps:
1. Prepare a trouble ticket stating that the network is running too slowly.
2. Submit the trouble ticket.

Documenting Trouble Ticket Changes
The exercise requires the student to locate a particular trouble ticket, make changes in trouble ticket fields, and have the changes applied to the trouble ticket.

Perform the following steps:
1. Display the specified trouble ticket on the workstation screen.
2. Make entries in the Detailed Resolution Log and Resolution Log indicating a solution to the problem.
3. Change the Ticket Status to “Solution Proposed”.
4. Apply the changes to the trouble ticket.
