Preface

This document is a Users Guide for HDF-EOS (Hierarchical Data Format - Earth Observing System) library tools. The version described in this document is HDF-EOS Version 5.1.2. The software is based on HDF5, a new version of HDF provided by NCSA. HDF5 is a complete rewrite of the earlier HDF4 version, containing a different data model and user interface. HDF-EOS V5.1.2 incorporates HDF5, and keeps the familiar HDF4-based interface. There are a few exceptions and these exceptions are described in this document. Note that the major functional difference is that Version 5.1.2 of the HDF-EOS library is a thread-safe.

HDF is the scientific data format standard selected by NASA as the baseline standard for EOS. This Users Guide accompanies Version 5.1.2 software, which is available to the user community on the EDHS1 server. This library is aimed at EOS data producers and consumers, who will develop their data into increasingly higher order products. These products range from calibrated Level 1 to Level 4 model data. The primary use of the HDF-EOS library will be to create structures for associating geolocation data with their associated science data. This association is specified by producers through use of the supplied library. Most EOS data products which have been identified, fall into categories of Point, Grid or Swath structures, the latter two of which are implemented in the current version of the library. Services based on geolocation information will be built on HDF-EOS structures. Producers of products not covered by these structures, e.g. non-geolocated data, can use the standard HDF libraries.

In the ECS (EOS Core System) production system, the HDF-EOS library will be used in conjunction with SDP (Science Data Processing) Toolkit software. The primary tools used in conjunction with HDF-EOS library will be those for metadata handling, process control and status message handling. Metadata tools will be used to write ECS inventory and granule specific metadata into HDF-EOS files, while the process control tools will be used to access physical file handles used by the HDF tools. (SDP Toolkit Users Guide for the ECS Project, November 2000, 333-CD-600-001).

HDF-EOS5 is an extension of NCSA (National Center for Supercomputing Applications) HDF5 and uses HDF5 library calls as an underlying basis. Version 5.1.4.1 of HDF5 is used. The library tools are written in the C language and a FORTRAN interface is provided. The current version contains software for creating, accessing and manipulating Grid, Point and Swath structures. This document includes overviews of the interfaces, and code examples. HE5View, the HDF-EOS viewing tool, has been revised to accommodate the current version of the library.

Note that HDF-EOS V2.X, a separate library based on HDF4, is also available. Both versions of HDF-EOS will be supported by ECS.

Abstract

This document will serve as the user’s guide to the HDF-EOS file access library based on HDF5. HDF refers to the scientific data format standard selected by NASA as the baseline standard for EOS, and HDF-EOS refers to EOS conventions for using HDF. This document will provide information on the use of the three interfaces included in HDF-EOS – Point, Swath, and Grid – including overviews of the interfaces, and code examples. This document should be suitable for use by data producers and data users alike.

Keywords: HDF-EOS, HDF5, Metadata, Standard Data Format, Standard Data Product, Disk Format, Grid, Point, Swath, Projection, Array, Browse

Abbreviations and Acronyms
1. Introduction

1.1 Purpose
The *HDF-EOS Software Reference Guide for the ECS Project* was prepared under the Earth Observing System Data and Information System (EOSDIS) Core System (ECS), Contract (NAS5-60000).

This software reference guide is intended for use by anyone who wishes to use the HDF-EOS library to create or read EOS data products. Users of this document will include EOS instrument team science software developers and data product designers, DAAC personnel, and end users of EOS data products such as scientists and researchers.

1.2 Organization
This paper is organized as follows:
- Section 1 Introduction - Presents Scope and Purpose of this document
- Section 2 Function Reference
- Abbreviations and Acronyms

1.3 Point Data
The Point (PT) interface consists of routines for storing, retrieving, and manipulating data in point data sets.

1.3.1 The Point Data Interface
All C routine names in the Point data interface have the prefix “HE5_PT” and the equivalent FORTRAN routine names are prefixed by “he5_pt.” The Point routines are classified into the following categories:
- **Access routines** initialize and terminate access to the Point interface and Point data sets (including opening and closing files).
- **Definition** routines allow the user to set key features of a Point data set.
- **Basic I/O** routines read and write data and metadata to a Point data set.
- **Index I/O** routines read and write information which links two tables in a Point data set.
- **Inquiry** routines return information about data contained in a Point data set.
- **Subset** routines allow reading of data from a specified geographic region.
1.3.2 List of Point API Routines

The Point function calls are listed in Table 1-1 and are described in detail in the Software Reference Guide that accompanies this document. The page number column in the following table refers to the Software Reference Guide.

1.4 Swath Data

The Swath (SW) interface consists of routines for storing, retrieving, and manipulating data in swath data sets. This interface is tailored to support time-ordered data such as satellite swaths (which consist of a time-ordered series of scanlines), or profilers (which consist of a time-ordered series of profiles). See the Users’ Guide, Volume 1 that accompanies this document for more information.

1.4.1 The Swath Data Interface

All C routine names in the swath data interface have the prefix “HE5_SW” and the equivalent FORTRAN routine names are prefixed by “he5_sw.” The Swath routines are classified into the following categories:

- **Access routines** initialize and terminate access to the Swath interface and Swath data sets (including opening and closing files).
- **Definition** routines allow the user to set key features of a Swath data set.
- **Basic I/O** routines read and write data and metadata to a Swath data set.
- **Inquiry** routines return information about data contained in a Swath data set.
- **Subset** routines allow reading of data from a specified geographic region.

1.4.2 List of Swath API Routines

The Swath function calls are listed below in Table 1-2 and are described in detail in Section 2 of this document. The listing in Section 2 is in alphabetical order.
<table>

1.5 Grid Data

The Grid (GD) interface consists of routines for storing, retrieving, and manipulating data in Grid data sets. This interface is designed to support data that has been stored in a rectilinear
array based on a well defined and explicitly supported projection. See the Users’ Guide, Volume 1 that accompanies this document for more details.

1.5.1 The Grid Data Interface

All C routine names in the Grid data interface have the prefix “HE5_GD” and the equivalent FORTRAN routine names are prefixed by “he5_gd.” The GD routines are classified into the following categories:

- **Access routines** initialize and terminate access to the Grid interface and Grid data sets (including opening and closing files).
- **Definition** routines allow the user to set key features of a Grid data set.
- **Basic I/O** routines read and write data and metadata to a Grid data set.
- **Inquiry** routines return information about data contained in a Grid data set.
- **Subset** routines allow reading of data from a specified geographic region.

1.5.2 List of Grid API Routines

The Grid function calls are listed below in Table 1-3 and are described in detail in Section 2 of this document. The listing in Section 2 is in alphabetical order.

### Table 1-3. Summary of the Grid Interface (1 of 3)

### 1.6 GCTP Usage

The HDF-EOS Grid API uses the U.S. Geological Survey General Cartographic Transformation Package (GCTP) to define and subset grid structures. This section describes codes used by the package.

#### 1.6.1 GCTP Projection Codes

The following GCTP projection codes are used in the grid API described in Section 4 below:

- **HE5_GCTP_ALBERS** (Albers Conical Equal-Area Projection)
- **HE5_GCTP_MERCAT** (Mercator Projection)
- **HE5_GCTP_SPCS** (State Plane Coordinate System)
- **HE5_GCTP_GEO** (Geographic)
- **HE5_GCTP_UTM** (Universal Transverse Mercator)
- **HE5_GCTP_LAMCC** (Lambert Conformal Conic)
- **HE5_GCTP_PS** (Polar Stereographic)
- **HE5_GCTP_POLYC** (Polyconic)
- **HE5_GCTP_TM** (Transverse Mercator)
- **HE5_GCTP_LAMAZ** (Lambert Azimuthal Equal Area)
- **HE5_GCTP_HOM** (Hotine Oblique Mercator)
- **HE5_GCTP_SOM** (Space Oblique Mercator)
- **HE5_GCTP_GOOD** (Interrupted Goode Homolosine)
- **HE5_GCTP_ISINUS** (Integerized Sinusoidal Projection*)

* The Integerized Sinusoidal Projection is not part of the original GCTP package. It has been added by ECS. See *Level-3 SeaWiFS Data Products: Spatial and Temporal Binning Algorithms*. Additional references are provided in Section 2.

Note that other projections supported by GCTP will be adapted for HDF-EOS Version 5 as new user requirements are surfaced. For further details on the GCTP projection package, please refer to Section 6.3.4 and Appendix G of the SDP Toolkit Users Guide for the ECS Project, November 2000, (333-CD-600-001).
1.6.2 UTM Zone Codes

The Universal Transverse Mercator (UTM) Coordinate System uses zone codes instead of specific projection parameters. The table that follows lists UTM zone codes as used by GCTP Projection Transformation Package. C.M. is Central Meridian

</table>

Where,

Lon/Z: Longitude of any point in the UTM zone or zero. If zero, a zone code must be specified.

Lat/Z: Latitude of any point in the UTM zone or zero. If zero, a zone code must be specified.

Smajor: Semi-major axis of ellipsoid. If zero, Clarke 1866 in meters is assumed.

Sminor: Eccentricity squared of the ellipsoid if less than zero, if zero, a spherical form is assumed, or if greater than zero, the semi-minor axis of ellipsoid.

Sphere: Radius of reference sphere. If zero, 6370997 meters is used.

STDPR1: Latitude of the first standard parallel.
STDPR2  Latitude of the second standard parallel
CentMer  Longitude of the central meridian
OriginLat Longitude of the projection origin
FE        False easting in the same units as the semi-major axis
FN        False northing in the same units as the semi-major axis
TrueScale Latitude of true scale
LongPol   Longitude down below pole of map
Factor    Scale factor at central meridian (Transverse Mercator) or center of projection (Hotine Oblique Mercator)
CentLon   Longitude of center of projection
CenterLat Latitude of center of projection
Long1     Longitude of first point on center line (Hotine Oblique Mercator, format A)
Long2     Longitude of second point on center line (Hotine Oblique Mercator, format A)
Lat1      Latitude of first point on center line (Hotine Oblique Mercator, format A)
Lat2      Latitude of second point on center line (Hotine Oblique Mercator, format A)
AziAng    Azimuth angle east of north of center line (Hotine Oblique Mercator, format B)
AzmthPt   Longitude of point on central meridian where azimuth occurs (Hotine Oblique Mercator, format B)
IncAng    Inclination of orbit at ascending node, counter-clockwise from equator (SOM, format A)
AscLong   Longitude of ascending orbit at equator (SOM, format A)
PSRev     Period of satellite revolution in minutes (SOM, format A)
SRat      Satellite ratio to specify the start and end point of x,y values on earth surface (SOM, format A -- for Landsat use 0.5201613)
PFlag     End of path flag for Landsat: 0 = start of path, 1 = end of path (SOM, format A)
Satnum    Landsat Satellite Number (SOM, format B)
Path      Landsat Path Number (Use WRS-1 for Landsat 1, 2 and 3 and WRS-2 for Landsat 4 and 5.) (SOM, format B)
Nzone  Number of equally spaced latitudinal zones (rows); must be two or larger and even

Rflag  Right justify columns flag is used to indicate what to do in zones with an odd number of columns. If it has a value of 0 or 1, it indicates the extra column is on the right (zero) or left (one) of the projection Y-axis. If the flag is set to 2 (two), the number of columns are calculated so there are always an even number of columns in each zone.

Notes:

- HDF-EOS variable is used by the library function HE5_GDblksomoffset.
- Array elements 14 and 15 are set to zero.
- All array elements with blank fields are set to zero.

All angles (latitudes, longitudes, azimuths, etc.) are entered in packed degrees/minutes/seconds (DDDMMMSSS.SS) format.

The following notes apply to the Space Oblique Mercator A projection:

- A portion of Landsat rows 1 and 2 may also be seen as parts of rows 246 or 247. To place these locations at rows 246 or 247, set the end of path flag (parameter 11) to 1—end of path. This flag defaults to zero.

- When Landsat-1,2,3 orbits are being used, use the following values for the specified parameters:
  - Parameter 4  099005031.2
  - Parameter 5  128.87 degrees - (360/251 * path number) in packed DMS format
  - Parameter 9  103.2669323
  - Parameter 10  0.5201613

- When Landsat-4,5 orbits are being used, use the following values for the specified parameters:
  - Parameter 4  098012000.0
  - Parameter 5  129.30 degrees - (360/233 * path number) in packed DMS format
  - Parameter 9  98.884119
  - Parameter 10  0.5201613

2. Function Reference

2.1 Format

This section contains a function-by-function reference for each interface in the HDF-EOS library. Each function has a separate page describing it (in some cases there are multiple pages). Each page contains the following information (in order):

- Function name as used in C
- Function declaration in ANSI C format
- Description of each argument
- Purpose of routine
- Description of returned value
- Description of the operation of the routine
- A short example of how to use the routine in C
- The FORTRAN declaration of the function and arguments
- An equivalent FORTRAN example

2.1.1 Point Interface Functions

This section contains an alphabetical listing of all the functions in the Point interface. The functions are alphabetized based on their C-language names.
Attach to an Existing Point Structure

HE5_PTattach

hid_t HE5_PTattach(hid_t fid, const char *pointname)

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fid</td>
<td>IN: Point file ID returned by HE5_PTopen</td>
</tr>
<tr>
<td>pointname</td>
<td>IN: Name of point to be attached</td>
</tr>
</tbody>
</table>

Purpose
Attaches to an existing point within the file.

Return value
Returns the point handle (pointID) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper point file ID or point name.

Description
This routine attaches to the point using the pointname parameter as the identifier.

Example
In this example, we attach to the previously created point, "ExamplePoint", within the HDF-EOS file, Point.he5, referred to by the handle, fid:

pointID = HE5_PTattach(fid, "ExamplePoint");

The point can then be referenced by subsequent routines using the handle, pointID.

FORTRAN
integer function he5_ptattach(fid, pointname)

integer fid
character*(*) pointname

The equivalent FORTRAN code for the example above is:

pointid = he5_ptattach(fid, "ExamplePoint")
Return Information About a Point Attribute

**HE5_PTattrinfo**

```c
herr_t HE5_PTattrinfo(hid_t pointID, const char *attrname, H5T_class_t *numbertype, hsize_t *count)
```

- **pointID** IN: Point ID returned by HE5_PTcreate or HE5_PTattach
- **attrname** IN: Attribute name
- **numbertype** OUT: Data type class ID of attribute
- **count** OUT: Number of total bytes in attribute

**Purpose** Returns information about a point attribute

**Return value** Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

**Description** This routine returns number type and number of elements (count) of a point attribute.

**Example** In this example, we return information about the `ScalarFloat` attribute.

```c
status = HE5_PTattrinfo(pointID, "ScalarFloat", &nt, &count);
```

The `nt` variable will have the value 1 and `count` will have the value 4.

**FORTRAN**

```fortran
integer function he5_ptattrinfo(pointid,attrname,ntype,count)
integer pointid
character *(* attrname
integer ntype
integer*4 count
```

The equivalent `FORTRAN` code for the example above is:

```fortran
pointid = he5_ptattrinfo(pointid, "ScalarFloat", ntype, count)
```
Return Linkage Field to Previous Level

**HE5_PTbcklinkinfo**

herr_t HE5_PTbcklinkinfo(hid_t pointID, int level, char *linkfield)

- **pointID** IN: Point ID returned by HE5_PTcreate or HE5_PTattach
- **level** IN: Point level (0-based)
- **linkfield** OUT: Link field

**Purpose**
Returns the linkfield to the previous level.

**Return value**
Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

**Description**
This routine returns the linkfield to the previous level.

**Example**
In this example, we return the linkfield connecting the Observations level to the previous Desc-Loc level. (This levels are defined in the HE5_PTdeflevel routine.)

```
status = HE5_PTbcklinkinfo(pointID2, 1, linkfield);
```

The linkfield will contain the string: ID.

**FORTRAN**

define function he5_ptbcklinkinfo(pointid, level, linkfield)

```
integer pointid, status
character *(* linkfield
integer level
```

The equivalent **FORTRAN** code for the example above is:

```
level = 1
status = he5_ptbcklinkinfo(pointid, level, linkfield)
```
Close an HDF-EOS File

HE5_PTclose

herr_t HE5_PTclose(hid_t fid)

- **Purpose**: Closes file.
- **Return value**: Returns SUCCEED (0) if successful or FAIL (-1) otherwise.
- **Description**: This routine closes the HDF-EOS Point file.

**Example**

```c
status = HE5_PTclose(fid);
```

**FORTRAN**

```fortran
integer function he5_ptclose(fid)
integer fid
The equivalent FORTRAN code for the example above is:
status = he5_ptclose(fid)
```
Create a New Point Structure

**HE5_PTcreate**

hid_t HE5_PTcreate(hid_t *fid, const char *pointname)

- **fid** IN: Point file ID returned by HE5_PTopen
- **pointname** IN: Name of point to be created

**Purpose**

Creates a point within the file.

**Return value**

Returns the point handle (pointID) if successful or FAIL (-1) otherwise.

**Description**

The point is created as a Compound dataset within the HDF-EOS file with the name **pointname**.

**Example**

In this example, we create a new point structure, **ExamplePoint**, in the previously created file, **Point.he5**.

```c
pointID = HE5_PTcreate(fid, "ExamplePoint");
```

The point structure is then referenced by subsequent routines using the handle, **pointID**.

**FORTRAN**

integer function he5_ptcreate(fid,pointname)

integer pointid, fid

character *(* pointname

The equivalent **FORTRAN** code for the example above is:

```fortran
pointid = he5_ptcreate(fid, "ExamplePoint")
```
Define a New Level Within a Point

HE5_PTdeflevel

herr_t HE5_PTdeflevel(hid_t pointID, const char *levelname, HE5_CmpDTSinfo *levelinfo)

- **pointID** IN: Point ID returned by HE5_PTcreate or HE5_PTattach
- **levelname** IN: Name of level to be defined
- **levelinfo** IN: C-data structure containing all necessary information about level to be defined

**Note:** Merging is not supported in this release of the library. There are three illegal characters for field names: “/”, “;”, “,”.

**Purpose** Defines a new level within the point.

**Return value** Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

**Description** This routine defines a level within the point. A simple point consists of a single level. A point where there is common data for a number of records can be more efficiently stored with multiple levels. The order in which the levels are defined determines the (0-based) level index.

**Example** Simple Point

In this example, we define a simple single level point, with levelname, Sensor. The levelname should not contain any slashes (“/”). It consists of six fields, ID, Time, Longitude, Latitude, Temperature, and Mode defined in the field list. The fieldtype and fieldorder parameters are arrays consisting of the HDF number type codes and field orders, respectively. The Temperature is an array field of dimension 4 and the Mode field a character string of size 4. All other fields are scalars. Note that the order for numerical scalar variables can be either 0 or 1.

```c
typedef struct {
    int     id;
    int     time;
    float   lon;
    float   lat;
    float   temp[4];
    char    mode[4];
};
```
HE5_CmpDTSinfo  dtsinfo;
dtsinfo.nfields = 6;
dtsinfo.rank[0] = 1;
dtsinfo.rank[1] = 1;
dtsinfo.rank[2] = 1;
dtsinfo.rank[3] = 1;
dtsinfo.rank[4] = 1;
dtsinfo.rank[5] = 1;
for (i = 0; i < 6; i++)
    dtsinfo.fieldname[i] = (char *)malloc(64,sizeof(char));

strcpy(dtsinfo.fieldname[0], “ID”);
strcpy(dtsinfo.fieldname[1], “Time”);
strcpy(dtsinfo.fieldname[2], “Longitude”);
strcpy(dtsinfo.fieldname[3], “Latitude”);
strcpy(dtsinfo.fieldname[4], “Temperature”);
strcpy(dtsinfo.fieldname[5], “Mode”);

dtsinfo.offset[0] = HOFFSET(InputData1, id);
dtsinfo.offset[1] = HOFFSET(InputData1, time);
dtsinfo.offset[2] = HOFFSET(InputData1, lon);
dtsinfo.offset[3] = HOFFSET(InputData1, lat);
dtsinfo.offset[4] = HOFFSET(InputData1, temp);
dtsinfo.offset[5] = HOFFSET(InputData1, mode);

dtsinfo.datatype[0] = H5T_NATIVE_INT;
dtsinfo.datatype[1] = H5T_NATIVE_INT;
dtsinfo.datatype[2] = H5T_NATIVE_FLOAT;
dtsinfo.datatype[3] = H5T_NATIVE_FLOAT;
dtsinfo.datatype[4] = H5T_NATIVE_FLOAT;
dtsinfo.datatype[5] = H5T_NATIVE_CHAR;

dtsinfo.dims[0][0] = 1;
dtsinfo.dims[1][0] = 1;
dtsinfo.dims[2][0] = 1;
dtsinfo.dims[3][0] = 1;
dtsinfo.dims[4][0] = 4;
dtsinfo.dims[5][0] = 4;

dtsinfo.datasize = sizeof(InputData1);
status = HE5_PTdeflevel(pointID1, "Sensor", &dtsinfo);
for (i = 0; i < 6; i++)
    free(dtsinfo.fieldname[i]);

Multi-Level Point

In this example, we define a two-level point that describes data from a network of fixed buoys. The first level contains information about each buoy and includes the name (label) of the buoy, its (fixed) longitude and latitude, its deployment date, and an ID that is used to link it to the following level. (The link field is defined in the HE5_PTdeflinkage routine described later.) The entries within this ID field must be unique. The second level contains the actual measurements from the buoys (rainfall and temperature values) plus the observation time and the ID which relates a given measurement to a particular buoy entry in the previous level. There can be many records in this level with the same ID since there can be multiple measurements from a single buoy. It is advantageous, although not mandatory, to store all records for a particular buoy (ID) contiguously.

Level 0
HE5_CmpDTSinfo lev0_info;
typedef struct {
    char     label[8];
    double   lon;
    double   lat;
} lev0_info;
float    deploydate;
char     id;
)

lev0_info.nfields = 5;
lev0_info.rank[0] = 1;
lev0_info.rank[1] = 1;
lev0_info.rank[2] = 1;
lev0_info.rank[3] = 1;
lev0_info.rank[4] = 1;
for (i = 0; i < 5; i++)
    lev0_info.fieldname[i] = (char *)calloc(64,sizeof(char));

strcpy(lev0_info.fieldname[0], "Label");
strcpy(lev0_info.fieldname[1], "Longitude");
strcpy(lev0_info.fieldname[2], "Latitude");
strcpy(lev0_info.fieldname[3], "DeployDate");
strcpy(lev0_info.fieldname[4], "ID");

lev0_info.offset[0] = HOFFSET(Lev0_Data, label);
lev0_info.offset[1] = HOFFSET(Lev0_Data, lon);
lev0_info.offset[2] = HOFFSET(Lev0_Data, lat);
lev0_info.offset[3] = HOFFSET(Lev0_Data, deploydate);
lev0_info.offset[4] = HOFFSET(Lev0_Data, id);

lev0_info.datatype[0] = H5T_NATIVE_CHAR;
lev0_info.datatype[1] = H5T_NATIVE_DOUBLE;
lev0_info.datatype[2] = H5T_NATIVE_DOUBLE;
lev0_info.datatype[3] = H5T_NATIVE_FLOAT;
lev0_info.datatype[4] = H5T_NATIVE_CHAR;
lev0_info.dims[0][0] = 8;
lev0_info.dims[1][0] = 1;
lev0_info.dims[2][0] = 1;
lev0_info.dims[3][0] = 1;
lev0_info.dims[4][0] = 1;
lev0_info.datasize = sizeof(Lev0_Data);

status = HE5_PTdeflevel(pointID2, "Desc-Loc", &lev0_info);
for (i = 0; i < 5; i++)
  free (lev0_info.fieldname[i]);

Level 1
HE5_CmpDTSinfo  lev1_info;
typedef struct {
  double   time;
  float    rain;
  float    temp;
  char     id;
} Lev1_Data;
lev1_info.nfields = 4;
lev1_info.rank[0] = 1;
lev1_info.rank[1] = 1;
lev1_info.rank[2] = 1;
lev1_info.rank[3] = 1;
for (i = 0; i < 4; i++)
  lev1_info.fieldname = (char *)calloc(64,sizeof(char));

strcpy(lev1_info.fieldname[0], "Time");
strcpy(lev1_info.fieldname[1], "Rainfall");
strcpy(lev1_info.fieldname[2], "Temperature");
strcpy((lev1_info.fieldname[3], "ID");

lev1_info.offset[0] = HOFFSET(Lev1_Data, time);
lev1_info.offset[1] = HOFFSET(Lev1_Data, rain);
lev1_info.offset[2] = HOFFSET(Lev1_Data, temp);
lev1_info.offset[3] = HOFFSET(Lev1_Data, id);

lev1_info.datatype[0] = H5T_NATIVE_DOUBLE;
lev1_info.datatype[1] = H5T_NATIVE_FLOAT;
lev1_info.datatype[2] = H5T_NATIVE_FLOAT;
lev1_info.datatype[3] = H5T_NATIVE_CHAR;

lev1_info.dims[0][0] = 1;
lev1_info.dims[1][0] = 1;
lev1_info.dims[2][0] = 1;
lev1_info.dims[3][0] = 1;

lev1_info.datasize = sizeof(Lev1_Data);

status = HE5_PTdeflevel(pointID2, "Observations",
&lev1_info);

for (i = 0; i < 4; i++)
    free(lev1_info.fieldname[i]);

FORTRAN See Example 2 from Section 7.1.1.2 of Volume 1 (Overview and Examples)
Define Linkage Field Between Two Levels

**HE5_PTdeflinkage**

herr_t HE5_PTdeflinkage(hid_t pointID, char *parent, char *child, char *linkfield)

- **pointID** IN: Point ID returned by HE5_PTcreate or HE5_PTattach
- **parent** IN: Name of parent level
- **child** IN: Name of child level
- **linkfield** IN: Name of (common) link field

**Purpose**
Defines a link field between two (adjacent) levels.

**Return value**
Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

**Description**
This routine defines the link field between two levels. This field must be defined in both levels.

**Note**
The defining of a linkage is necessary if more than one level is defined.

**Example**
In this example we define the ID field as the link between the two levels defined previously in the HE5_PTdeflevel routine.

```
status = HE5_PTdeflinkage(pointID2, "Desc-Loc", "Observations", "ID");
```

**FORTRAN**

integer function he5_ptdeflinkage(pointid,levelname1,levelname2,linkname)

integer pointid,status

character *(* linkname,levelname1,levelname2

The equivalent FORTRAN code for the example above is:

```
status = he5_ptdeflinkage(pointid, "Desc-Loc", "Observations", "ID")
```
HE5_PTdetach

herr_t HE5_PTdetach(hid_t pointID)

pointID  IN:  Point ID returned by HE5_PTcreate or HE5_PTattach
Purpose  Detaches from point data set.
Return value  Returns SUCCEED (0) if successful or FAIL (-1) otherwise.
Description  This routine should be run before exiting from the point file for every
point opened by HE5_PTcreate or HE5_PTattach.
Example  In this example, we detach the point structure, ExamplePoint:

```c
status = HE5_PTdetach(pointID);
```

FORTRAN

integer function he5_ptdetach(pointid)

integer  pointid, status

The equivalent FORTRAN code for the example above is:

```fortran
status = he5_ptdetach(pointid)
```
Return Linkage Field to Following Level

**HE5_P Tfwdlinkinfo**

```c
herr_t HE5_P Tfwdlinkinfo(hid_t pointID, int level, char *linkfield)
```

- **pointID** IN:  Point ID returned by HE5_P Tcreate or HE5_P Tattach
- **level** IN:  Point level (0-based)
- **linkfield** OUT:  Link field

**Purpose**

Returns the link field to the following level.

**Return value**

Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

**Description**

This routine returns the link field to the following level.

**Example**

In this example, we return the link field connecting the *Desc-Loc* level to the following *Observations* level. (These levels are defined in the HE5_P Tdeflevel routine.)

```c
status = HE5_P Tfwdlinkinfo(pointID2, 1, linkfield);
```

The `linkfield` will contain the string: *ID*.

**FORTRAN**

```fortran
integer function he5_ptfwdlinkinfo(pointid,level,linkfield)
  integer           pointid,status
  character (*)     linkfield
  integer           level
```

The equivalent FORTRAN code for the example above is:

```fortran
level = 1
status = he5_ptfwdlinkinfo(pointid, level, linkfield)
```
Return Level Name

HE5_PTgetlevelname

herr_t HE5_PTgetlevelname(hid_t pointID, int level, char *levelname, long *strbufsize)

pointID IN: Point ID returned by HE5_PTcreate or HE5_PTattach
level IN: Point level (0-based)
levelname OUT: Level name
strbufsize OUT: String length of level name

Purpose Returns the name of a level given the level number.

Return value Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

Description This routine returns the name of a level given the level number (0-based). If the user passes NULL for the level name, the routine will return just the string length of the level name (not counting the null terminator).

Example In this example, we return the level name of the 0th level of the second point defined in the HE5_PTdeflevel section:

```
status = HE5_PTgetlevelname(pointID2, 0, levelname, &strbufsize);
```

The `levelname` will contain the string: Desc-Loc and the `strbufsize` variable will be set to 8.

FORTRAN integer function he5_ptgetlevelname(pointid, level, levelname, strbufsz)

```
integer pointid, status, level
character (*) levelname
integer*4 strbufsz
```

The equivalent FORTRAN code for the example above is:

```
level = 0
status = he5_ptgetlevelname(pointid, level, levelname, strbufsz)
```
Return Record Numbers Related to Level

**HE5_PTgetrecnums**

```c
herr_t HE5_PTgetrecnums(hid_t pointID, int inlevel, int outlevel, hsize_t inNrec,
                         hssize_t inRecs[], hsize_t *outNrec, hsize_t outRecs[])
```

- **pointID** IN: Point ID returned by HE5_PTcreate or HE5_PTattach
- **inlevel** IN: Level number of input records (0-based)
- **outlevel** IN: Level number of output records (0-based)
- **inNrec** IN: Number of records in the `inRecs` array
- **inRecs** IN: Array containing the input record numbers.
- **outNrec** OUT: Number of records in the `outRecs` array
- **outRecs** OUT Array containing the output record numbers.

**Purpose** Returns the record numbers in one level corresponding to a group of records in a different level.

**Return value** Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

**Description** The records in one level are related to those in another through the link field. These in turn are related to the next. In this way each record in any level is related to others in all the levels of the point structure. The purpose of `HE5_PTgetrecnums` is to return the record numbers in one level that are connected to a given set of records in a different level. Note that the two levels need not be adjacent.

**Example** In this example, we get the record number in the second level that are related to the first record in the first level.

```c
nrec = 1;
recs[0] = 0;
inLevel = 0;
outLevel = 1;
status = HE5_PTgetrecnums(pointID2, inLevel, outLevel, nrec, recs, &outNrec, outRecs);
```

**FORTRAN** Not available with this release.
Return Information About Group Attribute

HE5_PTgrpattrinfo

herr_t HE5_PTgrpattrinfo(hid_t pointID, const char *attrname, H5T_class_t *numbertype, hsize_t *count)

pointID IN: Point ID returned by HE5_PTcreate or HE5_PTattach
attrname IN: Attribute name
numbertype OUT: Data type class ID of attribute
count OUT: Number of total bytes in attribute

Purpose Returns information about attribute associated with the point “Data” group
Return value Returns SUCCEED (0) if successful or FAIL (-1) otherwise.
Description This routine returns number type and number of elements (count) of an attribute associated with the point “Data” group.
Example In this example, we return information about the GroupFloat attribute.

```
status = HE5_PTgrpattrinfo(pointID, "GroupFloat", &nt, &count);
```

The nt variable will have the value 1 and count will have the value 4.

FORTRAN

integer function he5_ptgrpattrinfo(pointid,attrname,ntype,count)
integer pointid,status
integer*4 count
integer ntype

The equivalent FORTRAN code for the example above is:

```
status = he5_ptgrpattrinfo(pointid, "GroupFloat", ntype, count)
```
Retrieve Information About Point Attributes

**HE5_PTinqattrs**

long HE5_PTinqattrs(hid_t pointID, char *attrlist, long *strbufsize)

- **pointID** IN: Point ID returned by HE5_PTcreate or HE5_PTattach
- **attrlist** OUT: Attribute list (entries separated by commas)
- **strbufsize** OUT: String length of attribute list

**Purpose** Retrieve information about attributes defined in point.

**Return value** Number of attributes found if successful or FAIL (-1) otherwise.

**Description** The attribute list is returned as a string with each attribute name separated by commas. If `attrlist` is set to NULL, then the routine will return just the string buffer size, `strbufsize`. This variable does not count the null string terminator.

**Example** In this example, we retrieve information about the attributes defined in a point structure. We assume that there are two attributes stored, `attrOne` and `attr_2`:

```c
nattr = HE5_PTinqattrs(pointID, NULL, strbufsize);
```

The parameter, `nattr`, will have the value 2 and `strbufsize` will have value 14.

```c
nattr = HE5_PTinqattrs(pointID, attrlist, strbufsize);
```

The variable, `attrlist`, will be set to:

"attrOne,attr_2".

**FORTRAN**

```fortran
integer*4 function he5_ptinqattrs(pointid, attrlist, strbufsz)
integer pointid
character *(*) attrlist
integer*4 nattr, strbufsz
```

The equivalent **FORTRAN** code for the example above is:

```fortran
nattr = he5_ptinqattrs(pointid, attrlist, strbufsz)
```
Retrieve Information About Group Attributes

HE5_PTinqgrpattrs

long HE5_PTinqgrpattrs(hid_t pointID, char *attrlist, long *strbufsize)

<table>
<thead>
<tr>
<th>pointID</th>
<th>IN:</th>
<th>Point ID returned by HE5_PTcreate or HE5_PTattach</th>
</tr>
</thead>
<tbody>
<tr>
<td>attrlist</td>
<td>OUT:</td>
<td>Attribute list (entries separated by commas)</td>
</tr>
<tr>
<td>strbufsize</td>
<td>OUT:</td>
<td>String length of attribute list</td>
</tr>
</tbody>
</table>

Purpose  Retrieve information about attributes defined in point “Data” group.

Return value  Number of attributes found if successful or FAIL (-1) otherwise.

Description  The attribute list is returned as a string with each attribute name separated by commas. If attrlist is set to NULL, then the routine will return just the string buffer size, strbufsize. This variable does not count the null string terminator.

Example  In this example, we retrieve information about the attributes defined in the “Data” group of point structure. We assume that there are two attributes stored, GrpAttrOne and GrpAttr_2:

```c
nattr = HE5_PTinqgrpattrs(pointID, NULL, strbufsize);
```

The parameter, nattr, will have the value 2 and strbufsize will have value 20.

```c
nattr = HE5_PTinqgrpattrs(pointID, attrlist, strbufsize);
```

The variable, attrlist, will be set to: "GrpAttrOne,GrpAttr_2".

FORTRAN  integer*4 function he5_ptinqgrpattrs(pointid,attrlist,strbufsz)

<table>
<thead>
<tr>
<th>pointid</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>attrlist</td>
<td>character <em>(</em></td>
</tr>
<tr>
<td>nattr,strbufsz</td>
<td>integer*4</td>
</tr>
</tbody>
</table>

The equivalent FORTRAN code for the example above is:

```fortran
nattr = he5_ptinqgrpattrs(pointid, attrlist, strbufsz)
```
Retrieve Information About Level Attributes

**HE5_PTinqlocattrs**

```c
long HE5_PTinqlocattrs(hid_t pointID, const char *levelname, char *attrlist, long *strbufsize)
```

- **pointID** (IN): Point ID returned by HE5_PTcreate or HE5_PTattach
- **levelname** (IN): Level name
- **attrlist** (OUT): Attribute list (entries separated by commas)
- **strbufsize** (OUT): String length of attribute list

**Purpose**: Retrieve information about attributes defined for a specified level in a point.

**Return value**: Number of attributes found if successful or FAIL (-1) otherwise.

**Description**: The attribute list is returned as a string with each attribute name separated by commas. If `attrlist` is set to NULL, then the routine will return just the string buffer size, `strbufsize`. This variable does not count the null string terminator.

**Example**: In this example, we retrieve information about the local attributes defined for the `Observations` level in a point structure. We assume that there are two attributes stored, `LocAttrOne` and `LocAttrTwo`:

```c
nattr = HE5_PTinqlocattrs(pointID, "Observations", NULL, strbufsize);
```

The parameter, `nattr`, will have the value 2 and `strbufsize` will have value 21.

```c
nattr = HE5_PTinqlocattrs(pointID, levelname, attrlist, strbufsize);
```

The variable, `attrlist`, will be set to: 

"LocAttrOne,LocAttrTwo".

**FORTRAN**

```fortran
integer*4 function he5_ptinqlocattrs(pointid,levelname,attrlist,strbufsz)
  integer       pointid
  character *(*) levelname, attrlist
```

---

2-21 175-TP-511-003
integer*4   nattr, strbufsz

The equivalent _FORTRAN_ code for the example above is:

nattr = he5_ptinqlocattrs(pointid, levelname, attrlist, strbufsz)
Retrieve Point Structures Defined in HDF-EOS File

**HE5_PTinqpoint**

```c
int HE5_PTinqpoint(const char * filename, char *pointlist, long *strbufsize)
```

- **filename** IN: HDF-EOS filename
- **pointlist** OUT: Point list (entries separated by commas)
- **strbufsize** OUT: String length of point list

**Purpose** Retrieves number and names of points defined in HDF-EOS file.

**Return value** Number of points found if successful or FAIL (-1) otherwise.

**Description** The point list is returned as a string with each point name separated by commas. If `pointlist` is set to NULL, then the routine will return just the string buffer size, `strbufsize`. If `strbufsize` is also set to NULL, the routine returns just the number of points. Note that `strbufsize` does not count the null string terminator.

**Example** In this example, we retrieve information about the points defined in an HDF-EOS file, `Point.he5`. We assume that there are two points stored, `PointOne` and `Point_2`:

```c
npoint = HE5_PTinqpoint("Point.he5", NULL, strbufsize);
```

The parameter, `npoint`, will have the value 2 and `strbufsize` will have value 16.

```c
npoint = HE5_PTinqpoint("Point.he5", pointlist, strbufsize);
```

The variable, `pointlist`, will be set to:

"PointOne,Point_2”.

**FORTRAN**

```fortran
integer function he5_ptinqpoint(filename,pointlist,strbufsz)
integer npoint
character *(*) pointlist
integer*4 strbufsz
```

The equivalent **FORTRAN** code for the example above is:

```fortran
npoint = he5_ptinqpoint("Point.he5", pointlist, strbufsz)
```
Return Index Number of a Named Level

HE5_PTlevelindx

int HE5_PTlevelindx(hid_t pointID, const char *levelname)

- **pointID** IN: Point ID returned by HE5_PTcreate or HE5_PTattach
- **levelname** IN: Level Name

**Purpose** Returns the level index (0-based) for a given (named) level.

**Return value** Returns the level index if successful or FAIL (-1) otherwise.

**Description** This routine returns the level index for a given level specified by name.

**Example** In this example, we return the level index of the Observations level in the multilevel point structure defined in HE5_PTdeflevel.

```c
levindx = HE5_PTlevelindx(pointID2, "Observations");
```

The `levindx` variable will have the value 1.

**FORTRAN**

integer function he5_ptlevelindx(pointid,levelname)

- integer `pointid,levindx`
- character `*(* `levelname`)

The equivalent **FORTRAN** code for the example above is:

```fortran
levindx = he5_ptlevelindx(pointid, "Observations")
```
Return Information on Fields in a Given Level

HE5_PTlevelinfo

herr_t HE5_PTlevelinfo(hid_t pointID, int level, HE5_CmpDTSinfo *info)

pointID IN: Point ID returned by HE5_PTcreate or HE5_PTattach
level IN: Point level (0-based)
info OUT: C-data structure containing the level information

Purpose Returns information on fields in a given level.

Return value Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper point ID or level number.

Description This routine returns information about the fields in a given level.

Example In this example we return information about the Desc-Loc (1st) level defined previously.

HE5_CmpDTSinfo lev0_info;

status = HE5_PTlevelinfo(pointID2, 0, &lev0_info);

The lev0_info.nfields data member will be set to 5. The lev0_info.fieldname array will be "Time,Longitude,Latitude,Channel,Value".

FORTRAN See Example 4 from Section 7.1.1.2 of Volume 1 (Overview of Examples).
Return Information About Level Attribute

**HE5_PTlocattrinfo**

herr_t HE5_PTlocattrinfo(hid_t pointID, const char *levelname, const char *attrname, H5T_class_t *numbertype, hsize_t *count)

- **pointID** IN: Point ID returned by HE5_PTcreate or HE5_Ptattach
- **levelname** IN: Level name
- **attrname** IN: Attribute name
- **numbertype** OUT: Data type class ID of attribute
- **count** OUT: Number of total bytes in attribute

**Purpose**

Returns information about point level attribute

**Return value**

Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

**Description**

This routine returns number type and number of elements (count) of an attribute associated with a specified level.

**Example**

In this example, we return information about the `LocalFloat` attribute associated with the level `Observations`.

```c
status = HE5_PTattrinfo(pointID, "Observations", "LocalFloat", &nt, &count);
```

The `nt` variable will have the value 1 and `count` will have the value 4.

**FORTRAN**

```fortran
integer function he5_ptlocattrinfo(pointid,levelname,attrname,ntype,count)
integer pointid,status,ntype
character (*) levelname, attrname
integer*4 count
```

The equivalent FORTRAN code for the example above is:

```fortran
status = he5_ptlocattrinfo(pointid, "Observations", "LocalFloat", ntype, count)
```
Return Number of Fields Defined in a Level

**HE5_Ptnfields**

```c
int HE5_Ptnfields(hid_t pointID, int level, char *fieldlist, long *strbufsize)
```

- **pointID** IN: Point ID returned by HE5_PTcreate or HE5_PTattach
- **level** IN: Level number (0-based)
- **fieldlist** OUT: Field list (entries separated by commas)
- **strbufsize** OUT: Size in bytes of fieldlist for level

**Purpose**

Returns number of fields in a level and the size of the fieldlist.

**Return value**

Returns number of fields if successful or FAIL (-1) otherwise.

**Description**

This routine returns the number of fields in a level and the size of the comma-separated fieldlist. This value does NOT count the null character at the end of the string.

**Example**

In this example we retrieve the number of levels in the 2nd point defined previously:

```c
nflds = HE5_Ptnfields(pointID2, 0, NULL, &strbufsize);
nflds = HE5_Ptnfields(pointID2, 0, fieldlist, &strbufsize);
```

The `nflds` variable will be 5 and the `strbufsize` variable equal to 38.

**FORTRAN**

```fortran
integer function he5_ptnfields(pointid2,level,fieldlist,strbufsz)
integer pointid2,level,nflds
character *(*) fieldlist
integer*4 strbufsz
```

The equivalent *FORTRAN* code for the example above is:

```fortran
level = 0
nflds = he5_ptnfields(pointid2, level, fieldlist, strbufsz)
```
## HE5_PTnlevels

```c
int HE5_PTnlevels(hid_t pointID)
```

- **pointID**
  - IN: Point ID returned by HE5_PTcreate or HE5_PTattach
- **Purpose**
  - Returns number of levels in a point.
- **Return value**
  - Returns number of levels if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper point ID.
- **Description**
  - This routine returns the number of levels in a point.
- **Example**
  - In this example we retrieve the number of levels in the 2nd point defined previously:
    ```c
    nlevels = HE5_PTnlevels(pointID2);
    The nlevels variable will be 2.
    ```

### FORTRAN

```fortran
integer function he5_ptnlevels(pointid)
integer pointid,nlevels
The equivalent FORTRAN code for the example above is:
```
```fortran
nlevels = he5_ptnlevels(pointid)
```
HE5_PTnrecs

hsize_t HE5_PTnrecs(hid_t pointID, int level)

pointID IN: Point ID returned by HE5_PTcreate or HE5_PTattach
level IN: Level number (0-based)

Purpose Returns number of records in a given level.

Return value Returns number of records in a given level if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper point id or level number.

Description This routine returns the number of records in a given level.

Example In this example we retrieve the number of records in the first level of the 2nd point defined previously:

nrecs = HE5_PTnrecs(pointID2, 0);

FORTRAN integer function he5_ptnrecs(pointid,level)

integer pointid2,level

The equivalent FORTRAN code for the example above is:

level = 0
status = he5_ptnrecs(pointid2, level)
Open HDF-EOS File

**HE5_PTopen**

hid_t HE5_PTopen(const char *filename, uintn access)

- **filename**   IN: Complete path and filename for the file to be opened
- **access**   IN: H5F_ACC_RDONLY, H5F_ACC_RDWR or H5F_ACC_TRUNC

**Purpose**
Opens or creates HDF-EOS file in order to create, read, or write a point.

**Return value**
Returns the point file ID (fid) if successful or FAIL (-1) otherwise.

**Description**
This routine creates a new file or opens an existing one, depending on the access parameter.

**Access codes:**
- H5F_ACC_RDONLY    Open for read only. If file does not exist, error
- H5F_ACC_RDWR    Open for read/write. If file does not exist, error
- H5F_ACC_TRUNC     If file exists, delete it, then open a new file for read/write

**Example**
In this example, we create a new point file named, *Point.he5*. It returns the file handle, *fid*.

```
fid = HE5_PTopen("Point.he5", H5F_ACC_TRUNC);
```

**FORTRAN**
integer function he5_ptopen(filename,flag)

integer       fid
character (*) filename
integer       HE5_HDFE_TRUNC
parameter     (HE5_HDFE_TRUNC=2)

The equivalent **FORTRAN** code for the example above is:

```
fid = he5_ptopen("Point.he5", HE5_HDFE_TRUNC)
```
Read Point Attribute

HE5_PTreadattr

herr_t HE5_PTreadattr(hid_t pointID, const char *attrname, void *datbuf)

- **pointID** IN: Point ID returned by HE5_PTcreate or HE5_PTattach
- **attrname** IN: Attribute name
- **datbuf** IN: Buffer allocated to hold attribute values

Purpose

Reads attribute from a point.

Return value

Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper point ID or number type or incorrect attribute name.

Description

The attribute is passed by reference rather than value in order that a single routine suffice for all numerical types.

Example

In this example, we read floating point attribute with the name "ScalarFloat":

```c
status = HE5_PTreadattr(pointID, "ScalarFloat", &attr_val);
```

FORTRAN

integer function he5_ptreadatt(pointid,attrname,buffer)

integer pointid,status
character (*) attrname
<valid type> buffer(*)

The equivalent FORTRAN code for the example above is:

```fortran
status = he5_ptreadatt(pointid, "ScalarFloat", buffer)
```
Read Point Group Attribute

HE5_PTreadgrpattr

herr_t HE5_PTreadgrpattr(hid_t pointID, const char *attrname, void *datbuf)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pointID</td>
<td>IN: Point ID returned by HE5_PTcreate or HE5_PTattach</td>
</tr>
<tr>
<td>attrname</td>
<td>IN: Attribute name</td>
</tr>
<tr>
<td>datbuf</td>
<td>IN: Buffer allocated to hold attribute values</td>
</tr>
</tbody>
</table>

Purpose
Reads attribute associated with the “Data” group in a point.

Return value
Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper point ID or number type or incorrect attribute name.

Description
The attribute is passed by reference rather than value in order that a single routine suffice for all numerical types.

Example
In this example, we read floating point attribute with the name "GroupFloat":

```c
status = HE5_PTreadgrpattr(pointID, "GroupFloat", &attr_val);
```

FORTRAN

```fortran
integer function he5_ptreadgrpattr(pointid,attrname,buffer)
  integer       pointid,status
  character *(*) attrname
  <valid type>  buffer(*)

The equivalent FORTRAN code for the example above is:

```
Read Point Level Attribute

HE5_PTreadlocattr

herr_t HE5_PTreadlocattr(hid_t pointID, const char *levelname, const char *attrname, void *datbuf)

- **pointID** IN: Point ID returned by HE5_PTcreate or HE5_PTattach
- **levelname** IN: Level name
- **attrname** IN: Attribute name
- **datbuf** IN: Buffer allocated to hold attribute values

**Purpose**
Reads attribute associated with a specified level in a point.

**Return value**
Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper point ID or number type or incorrect attribute name.

**Description**
The attribute is passed by reference rather than value in order that a single routine suffice for all numerical types.

**Example**
In this example, we read floating point attribute with the name "LocalFloat" defined in the Observations level:

```c
status = HE5_PTreadlocattr(pointID, "Observations", "LocalFloat", &attr_val);
```

**FORTRAN**
integer function he5_ptreadlocattr(pointid,levelname,attrname,buffer)

integer       pointid,status
character *(*) levelname,attrname
<valid type>  buffer(*)

The equivalent FORTRAN code for the example above is:

```fortran
status = he5_ptreadlocattr(pointid, "Observations", "LocalFloat", buffer)
```
Read Records From a Point Level

HE5_PTreadlevel

herr_t HE5_PTreadlevel(hid_t pointID, int level, HE5_CmpDTSinfo *inStruct,
  size_t *size, void *buffer)

pointID IN: Point ID returned by HE5_PTcreate or HE5_PTattach
level IN: Level to read (0-based)
inStruct IN: C-data structure containing information about specified level.
size_t IN: Size (in bytes) of data structure to read data to.
buffer OUT: Buffer to store data

Purpose Reads data from a point level.

Return value Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper point ID or level number.

Description This routine reads data from the specified fields and records of a single level in a point. An appropriate read buffer must be defined by the user.

Example In this example we read records from the first level in the point referred to by the point ID, pointID1. User should define data structure to store the output data, first. Suppose the user defined data structure to read the output data to is “Sensor”.

CmpDTSinfo   lev0_info;
CmpDTSinfo   input_info;
Sensor       *buffer;

/* Get all necessary information about level first */
status = HE5_Ptlevelinfo(pointID1, 0, &lev0_info);
/* Set up input data structure and calculate the data size */
nrecs = HE5_Ptnrecs(pointID1, 0);
buffer = (Sensor *)calloc(nrecs, sizeof(Sensor));
status = HE5_PTreadlevel(pointID1, 0, &lev0_info, datasize, buffer);

FORTRAN See Example 4 from Section 7.1.1.2 of Volume 1 (Overview of Examples).
## HE5_PTIinqdatatype

Return Data Type Information for a Level

The function `HE5_PTIinqdatatype` is used to return data type information about a specified level in a point.

### Function Signature

```c
herr_t HE5_PTIinqdatatype(hid_t pointID, const char *levelname, const char *attrname, int fieldgroup, hid_t *datatype, H5T_class_t *classid, H5T_order_t *order, size_t *size);
```

### Input Parameters

- **pointID**
  - **IN**: Point ID returned by `HE5_PTcreate` or `HE5_PTattach`.

- **levelname**
  - **IN**: Level name.

- **attrname**
  - **IN**: Attribute name.

- **fieldgroup**
  - **IN**: Field group flag:  
    - HE5_HDFE_DATAGROUP - 1  
    - HE5_HDFE_ATTRGROUP - 2  
    - HE5_HDFE_GRPATTRGROUP - 3  
    - HE5_HDFE_LOCATTRGROUP - 4

### Output Parameters

- **datatype**
  - **OUT**: Data type ID.

- **classID**
  - **OUT**: Data type class ID.

- **order**
  - **OUT**: Data type byte order.

- **size**
  - **OUT**: Data type size (in bytes).

### Purpose

Returns data type information about the specified level in the point.

### Return Value

Returns size in bytes of specified fields if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper point ID or level name.

### Example

In this example, we return the data type information for the Observations level in the point defined in the `HE5_PTdeflevel` routine.

```c
status = HE5_PTIinqdatatype(pointID, "Observations", NULL, fieldgroup, &datatype, &classid, &order, &size);
```

### FORTRAN

```fortran
integer function he5_pTIinqdatatype(pointid,levelname,attrname,fldgrp,dtype,classid,order,size)

integer pointid,status
```
integer  \( dtype, classid, order \)
integer*4  \( size \)
character *(*)  \( levelname \)
integer  \( HE5\_HDFE\_DATAGROUP \)
parameter  \( (HE5\_HDFE\_DATAGROUP=1) \)

The equivalent FORTRAN code for the example above is:

\[
\text{status} = \text{he5\_ptinqdatatype}(\text{pointid1}, \text{"Observations"}, \text{""}, \text{dtype}, \text{classid}, \text{order}, \text{size})
\]
Update Records in a Point Structure

**HE5_PTupdatelevel**

```c
herr_t HE5_PTupdatelevel(hid_t pointID, int level, char* fieldlist, hsize_t nrec,
                          hssize_t recs[], void *data)
```

- **pointID** IN: Point ID returned by HE5_PTcreate or HE5_PTattach
- **level** IN: Level to update (0-based)
- **fieldlist** IN: List of fields to update
- **nrec** IN: Number of records to update
- **recs** IN: Record number of records to update (0-based)
- **data** IN: Data buffer to be written

**Purpose**: Updates (corrects) data to a point level.

**NOTE**: Currently updating of a whole record is supported.

**Return value**: Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper point ID or unknown field name.

**Description**: This routine updates the specified fields and records of a single level.

**Example**: In this example we update records 0, 2, and 3 for the field *Concentration* in first level in the point refered to by the point ID, *pointID1*.

```c
hsize_t recs[3] = {0, 2, 3};

/* Fill Data Buffer */

status = HE5_PTupdatelevel(pointID1, 0, "Concentration", 3, recs, datbuf);
```

The user may update a single record or all records.

**FORTRAN**: See Example 5 from Section 7.1.1.2 of Volume 1 (Overview of Examples).
Write/Update Point Attribute

HE5_PTwriteattr

herr_HE5_PTwriteattr(hid_t pointID, const char *attrname, int ntype, hsize_t count, void *datbuf)

- **pointID**  
  IN: Point ID returned by HE5_PTcreate or HE5_PTattach

- **attrname**  
  IN: Attribute name

- **ntype**  
  IN: Number type of attribute

- **count**  
  IN: Number of values to store in attribute

- **datbuf**  
  IN: Attribute values

**Purpose**: Writes/Updates attribute in a point.

**Return value**: Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper point ID or number type.

**Description**: If the attribute does not exist, it is created. If it does exist, then the value(s) is (are) updated. The attribute is passed by reference rather than value in order that a single routine suffice for all numerical types. Because of this a literal numerical expression should not be used in the call.

**Example**: In this example, we write a floating point attribute with the name "ScalarFloat" and the value 3.14:

```c
attr_val = 3.14;
status = HE5_PTwriteattr(pointid, "ScalarFloat", H5T_NATIVE_FLOAT, 1, &attr_val);
```

We can update this value by simply calling the routine again with the new value:

```c
attr_val = 3.14159;
status = HE5_PTwriteattr(pointid, "ScalarFloat", H5T_NATIVE_FLOAT, 1, &attr_val);
```

**FORTRAN**: integer function he5_ptwriteattr(pointid, attrname, ntype, count, buffer)

- pointid, status, ntype
- character *(*) attrname
integer*4     count
<valid type>  buffer(*)
integer       HE5_HDFE_NATIVE_FLOAT
parameter     (HE5_HDFE_NATIVE_FLOAT=1)

The equivalent FORTRAN code for the example above is:

    count = 1

    status = he5_ptwriteattr(pointid, "ScalarFloat", HE5_HDFE_NATIVE_FLOAT, count, buffer)
Write/Update Point Group Attribute

HE5_PTwritegrpattr

herr_HE5_PTwritegrpattr(hid_t pointID, const char *attrname, int ntype, hsize_t count, void *datbuf)

- **pointID** IN: Point ID returned by HE5_PTcreate or HE5_PTattach
- **attrname** IN: Attribute name
- **ntype** IN: Number type of attribute
- **count** IN: Number of values to store in attribute
- **datbuf** IN: Attribute values

Purpose: Writes/Updates attribute associated with the “Data” group in a point.

Return value: Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper point ID or number type.

Description: If the attribute does not exist, it is created. If it does exist, then the value(s) is (are) updated. The attribute is passed by reference rather than value in order that a single routine suffice for all numerical types. Because of this a literal numerical expression should not be used in the call.

Example: In this example, we write a floating point group attribute with the name "GroupFloat" and the value 3.14:

```c
attr_val = 3.14;
status = HE5_PTwritegrpattr(pointid, "GroupFloat", H5T_NATIVE_FLOAT, 1, &attr_val);
```

We can update this value by simply calling the routine again with the new value:

```c
attr_val = 3.14159;
status = HE5_PTwritegrpattr(pointid, "GroupFloat", H5T_NATIVE_FLOAT, 1, &attr_val);
```

FORTRAN

integer function he5_ptwritegrpattr(pointid, attrname, ntype, count, buffer)

integer pointid, status, ntype

character *(* attrname
integer*4    count
<valid type> buffer(*)
integer     HE5_HDFE_NATIVE_FLOAT
parameter   (HE5_HDFE_NATIVE_FLOAT=1)

The equivalent FORTRAN code for the example above is:

count = 1

status = he5_ptwritegrpatr(pointid, "GroupFloat",
HE5_HDFE_NATIVE_FLOAT, count, buffer)
Write New Records to a Point Level

HE5_PTwritelevel

herr_t HE5_PTwritelevel(hid_t pointID, int level, hsize_t nrec[], size_t *size, void *data)

- **pointID**: IN: Point ID returned by HE5_PTcreate or HE5_PTattach
- **level**: IN: Level to write (0-based)
- **nrec**: IN: Number of records to write
- **size**: IN: Data size (bytes) to write
- **data**: IN: Data buffer to be written to the level

**Purpose**: Writes (appends) new records to a point level.

**Return value**: Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper point ID or level number.

**Description**: This routine writes (appends) full records to a level. The data buffer should be represented by the array of C-data type structures. The structure type should be consistent with that used in HE5_PTdeflevel().

**Example**: In this example we write 5 records to the first level in the point refered to by the point ID, pointID1.

```c
/* Fill Data Buffer */
 /* Calculate the data size (bytes) */
status = HE5_PTwritelevel(pointID1, 0, 5, datasize, datbuf);
```

**FORTRAN**: See Example 3 from Section 7.1.1.2 of Volume 1 (Overview of Examples).
Write/Update Point Level Attribute

HE5_PTwritelocattr

herr_HE5_PTwritelocattr(hid_t pointID, const char *levelname, const char *attrname, int ntype, hsize_t count, void *datbuf)

pointID        IN:    Point ID returned by HE5_PTcreate or HE5_PTattach
levelname      IN:    Level name
attrname      IN:    Attribute name
ntype         IN:    Number type of attribute
count         IN:    Number of values to store in attribute
datbuf        IN:    Attribute values

Purpose        Writes/Updates attribute associated with a specified level in a point.

Return value   Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical
                reasons for failure are an improper point ID or number type.

Description    If the attribute does not exist, it is created. If it does exist, then the
                value(s) is (are) updated. The attribute is passed by reference rather
                than value in order that a single routine suffice for all numerical types. Because
                of this a literal numerical expression should not be used in the call.

Example        In this example, we write a floating point attribute with the name
                "LocalFloat" and the value 3.14 associated with the level “Observations”:

                attr_val = 3.14;
                status = HE5_PTwritelocattr(pointid, "Observations", "LocalFloat", H5T_NATIVE_FLOAT, 1, &attr_val);

                We can update this value by simply calling the routine again with the new
                value:

                attr_val = 3.14159;
                status = HE5_PTwritelocattr(pointid, "Observations", "LocalFloat", H5T_NATIVE_FLOAT, 1, &attr_val);

FORTRAN        integer function
                he5_pt writelicattr(pointid,levelname,attrname,ntype,count,buffer)
integer       pointid, status, ntype
character *(* *) attrname, levelname
integer*4     count
<valid type>  buffer(*)
integer       HE5_HDFE_NATIVE_FLOAT
parameter      (HE5_HDFE_NATIVE_FLOAT=1)

The equivalent FORTRAN code for the example above is:

```fortran
count = 1
status = he5_ptwritelocattr(pointid, "Observations", "LocalFloat", HE5_HDFE_NATIVE_FLOAT, count, buffer)
```
2.1.2 Swath Interface Functions

This section contains an alphabetical listing of all the functions in the Swath interface. The functions are alphabetized based on their C-language names.
Return Information About an Alias

HE5_SWaliasinfo

herr_t HE5_SWaliasinfo(hid_t swathID, int fldgroup, const char *aliasname, int *length, char *buffer)

- **swathID** IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **fldgroup** IN: Field group flag
- **aliasname** IN: Name of alias to retrieve information about
- **length** OUT: Size of buffer in bytes
- **buffer** OUT: Buffer with original field name

Purpose: Return information about an alias

Return value: Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

Description: Creates aliases that can be used to refer to a Swath data field in addition to the name of the field.

Example:

```c
status = HE5_SWaliasinfo(swathID, HE5_HDFE_DATAGROUP, aliasname, length, NULL);
namebuffer = (char *)calloc(length + 1, sizeof(char));
status = HE5_SWaliasinfo(swathID, HE5_HDFE_DATAGROUP, aliasname, length, namebuffer);
```

FORTRAN:

```fortran
integer function he5_swaliasinfo (swathid, fldgroup, aliasname, length, buffer)
integer swathid, status
character(*) fldgroup
character(*) aliasname
integer(*) length
character(*) buffer
```

The equivalent FORTRAN code for the first example above is:

```fortran
aliaslist = "temps 0 to 30"
status = he5_swaliasinfo(swathid, "Temperature", aliaslist, length, buffer)
```
Attach to an Existing Swath Structure

HE5_SWattach

hid_t HE5_SWattach(hid_t *fid, const char *swathname)

fid IN: Swath file ID returned by HE5_SWopen
swathname IN: Name of swath to be attached
Purpose Attaches to an existing swath within the file.
Return value Returns the swath handle (swathID) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper swath file id or swath name.
Description This routine attaches to the swath using the swathname parameter as the identifier.
Example In this example, we attach to the previously created swath, "ExampleSwath", within the HDF-EOS file, Swath.he5, referred to by the handle, fid:

swathID = HE5_SWattach(fid, "ExampleSwath");

The swath can then be referenced by subsequent routines using the handle, swathID.

FORTRAN integer function he5_swattach(fid,swathname)

integer fid
character*(*) swathname

The equivalent FORTRAN code for the example above is:

swathid = he5_swattach(fid, "ExampleSwath")
Return Information About a Swath Attribute

**HE5_SWattrinfo**

```c
herr_t HE5_SWattrinfo(hid_t swathID, const char *attrname, H5T_class_t *ntype, hsize_t *count)
```

- **swathID** IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **attrname** IN: Attribute name
- **ntype** OUT: Number type of attribute
- **count** OUT: Number of total bytes in attribute

**Purpose**
Returns information about a swath attribute.

**Return value**
Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

**Description**
This routine returns number type and number of elements (count) of a swath attribute.

**Example**
In this example, we return information about the `ScalarFloat` attribute.

```c
status = HE5_SWattrinfo(swathID, "ScalarFloat", &nt, &count);
```

The `nt` variable will have the value 1 and `count` will have the value 4.

**FORTRAN**

```fortran
integer function he5_swattrinfo(swathid, attrname, ntype, count)
integer swathid
character(*) attrname
integer ntype
integer*4 count
```

The equivalent **FORTRAN** code for the example above is:

```fortran
status = he5_swattrinfo(swathid, "ScalarFloat", ntype, count)
```
Close an HDF-EOS File

**HE5_SWclose**

$herr_t$ HE5_SWclose($hid_t$ $fid$)

- **$fid$** IN: Swath file ID returned by HE5_SWopen
- **Purpose**: Closes file.
- **Return value**: Returns SUCCEED (0) if successful or FAIL (-1) otherwise.
- **Description**: This routine closes the HDF-EOS Swath file.
- **Example**

  ```c
  status = HE5_SWclose(fid);
  ```

  **FORTRAN**

  integer function he5_swclose($fid$)
  
  integer $fid$

  The equivalent **FORTRAN** code for the example above is:

  ```fortran
  status = he5_swclose(fid)
  ```
Retreive Compression Information for Field

HE5_SWcompinfo

herr_t HE5_SWcompinfo(hid_t swathID, const char *fieldname, int *compcode, int compparm[])

- **swathID** (IN): Swath ID returned by HE5_SWcreate or HE5_SWattach
- **fieldname** (IN): Fieldname
- **compcode** (OUT): HDF compression code
- **compparm** (OUT): Compression parameters

**Purpose**: Retrieves compression information about a field.

**Return value**: Returns SUCCEED(0) if successful or FAIL(-1) otherwise.

**Description**: This routine returns the compression code and compression parameters for a given field.

**Example**: To retrieve the compression information about the Opacity field defined in the HE5_SWdefcomp function:

```c
status = HE5_SWcompinfo(swathID, “Opacity”, &compcode, compparm);
```

The **compcode** parameter will be set to 4 and **compparm[0]** to 5.

**FORTRAN**:

```fortran
integer function he5_swcompinfo(gridid,fieldname compcode, compparm)
    integer swathid
    character(*) filename
    integer compcode
    integer compparm(*)
```

The equivalent **FORTRAN** code for the example above is:

```fortran
status = he5_swcompinfo(swathid, ’Opacity’, compcode, compparm)
```

The **compcode** parameter will be set to 4 and **compparm(1)** to 5.
Create a New Swath Structure

**HE5_SWcreate**

hid_t HE5_SWcreate(hid_t *fid, const char *swathname)

**Parameters**

- **fid**
  - IN: Swath file ID returned by HE5_SWopen

- **swathname**
  - IN: Name of swath to be created

**Purpose**

Creates a swath within the file.

**Return value**

Returns the swath handle (swathID) if successful or FAIL (-1) otherwise.

**Description**

The swath is created as a Group within the HDF-EOS file with the name `swathname`.

**Example**

In this example, we create a new swath structure, `ExampleSwath`, in the previously created file, `Swath.he5`.

```
swathID = HE5_SWcreate(fid, "ExampleSwath");
```

The swath structure is referenced by subsequent routines using the handle, `swathID`.

**FORTRAN**

```fortran
integer function he5_swcreate(fid, swathname)
  integer fid
  character*(*) swathname
  
The equivalent FORTRAN code for the example above is:

  swathid = he5_swcreate(fid, "ExampleSwath")
```

---

2-51 175-TP-511-003
Define a Longitude-Latitude Box Region for a Swath

HE5_SWdefboxregion

hid_t HE5_SWdefboxregion(hid_t swathID, double cornerlon[], double cornerlat[], int mode)

- **swathID**: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **cornerlon**: Longitude in decimal degrees of box corners
- **cornerlat**: Latitude in decimal degrees of box corners
- **mode**: Cross Track inclusion mode

**Purpose**: Defines a longitude-latitude box region for a swath.

**Return value**: Returns the swath region ID if successful or FAIL (-1) otherwise.

**Description**: This routine defines a longitude-latitude box region for a swath. It returns a swath region ID which is used by the HE5_SWextractregion routine to read all the entries of a data field within the region. A cross track is within a region if 1) its midpoint is within the longitude-latitude "box" (HE5_HDFE_MIDPOINT), or 2) either of its endpoints is within the longitude-latitude "box" (HE5_HDFE_ENDPOINT), or 3) any point of the cross track is within the longitude-latitude "box" (HE5_HDFE_ANYPOINT), depending on the inclusion mode designated by the user. All elements within an included cross track are considered to be within the region even though a particular element of the cross track might be outside the region. The swath structure must have both Longitude and Latitude (or Colatitude) fields defined.

**Example**: In this example, we define a region bounded by the 3 degrees longitude, 5 degrees latitude and 7 degrees longitude, 12 degrees latitude. We will consider a cross track to be within the region if its midpoint is within the region.

```c
double cornerlon[2] = {3., 7.};
double cornerlat[2] = {5., 12.};
int mode = HE5_HDFE_MIDPOINT;

hid_t regionID = HE5_SWdefboxregion(swathID, cornerlon, cornerlat, mode);
```
FORTRAN integer function he5_swdefboxreg(swathid, cornerlon, cornerlat, mode)
  integer swathid
  real*8 cornerlon(*)
  real*8 cornerlat(*)
  integer mode

The equivalent FORTRAN code for the example above is:

  parameter (HE5_HDFE_MIDPOINT=0)
  cornerlon(1) = 3.
  cornerlat(1) = 5.
  cornerlon(2) = 7.
  cornerlat(2) = 12.

  regionid = he5_swdefboxreg(swathid, cornerlon, cornerlat, HE5_HDFE_MIDPOINT)
Define Chunking Parameters

HE5_SWdefchunk

herr_t HE5_SWdefchunk(hid_t swathID, int chunk_rank, const hsize_t *chunk_dims)

- **swathID**  IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **chunk_rank**  IN: The number of chunk dimensions
- **chunk_dims**  IN: Chunk dimensions

**Purpose**
Defines chunking for subsequent field definitions

**Return Value**
Returns SUCCEED(0) if successful or FAIL(-1) otherwise

**Description**
This routine defines the chunking dimensions for fields defined following this function call, analogous to the procedure for setting the field compression scheme using HE5_SWdefcomp. The number of tile dimensions and subsequent field dimensions must be the same.

**Example**
We will define chunking for a two-dimensional field of size 2400 x 3600.

```c
chunk_dims[0] = 100;
chunk_dims[1] = 360;
status = HE5_SWdefchunk(swathID, 2, chunk_dims);
```

**FORTRAN**

```fortran
integer function he5_swdefchunk(swathid, chunk_rank,chunk_dims)
integer swathid
integer chunk_rank
integer*4 chunk_dims(*)
```

The equivalent FORTRAN code for the example above is:

```fortran
chunk_dims(1) = 360
chunk_dims(2) = 100
chunk_rank    = 2
status = he5_swdefchunk(swathid, chunk_rank, chunk_dims)
```
Define Compression with Data Chunking

HE5_SWdefcomchunk

herr_t HE5_SWdefcomchunk(hid_t swathID, int compcode, int *compparm, int ndims, const hsize_t *dim)

swathID IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
comcode IN: Compression method flag
compparm IN: Array of compression parameters
ndims IN: Rank of a field to compress
dim IN: Array of sizes of chunk

Purpose Compress the data field

Return value Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

Description This function allows the user to set compression for a data field with automatic chunking

Example In this example, we set (DEFLATE) compression for a field that is defined right after this call

```c
ndims       = 2
compparme   = 4;
compparm[0] = 6;
dim[0]      = 100;
dim[1]      = 200;
status = HE5_SWdefcomchunk(swathID, compcode, compparm, ndims, dim);
```

FORTRAN integer function he5_swdefcomch(swathid,compcode, compparm, ndims,dim)

```fortran
integer swathid
integer compcode
integer compparm(*)
integer ndims
integer*4 dim(*)
```
The equivalent *FORTRAN* code for the example above is:

```fortran
compcode    = 4
compparm(1) = 6
ndims       = 2
dim(1)      = 200
dim(2)      = 100
status = he5_swdefcomch(swathid, compcode, compparm, ndims, dim)
```
Set Swath Field Compression

**HE5_SWdefcomp**

```c
herr_t HE5_SWdefcomp(hid_t swathID, int compcode, int *compparm)
```

- **swathID**  
  IN: Swath ID returned by HE5_SWcreate or HE5_SWattach

- **compcode**  
  IN: HDF compression code

- **compparm**  
  IN: Compression parameters (if applicable)

**Note:** Only deflate compression is available in this release.

**Purpose**  
Sets the field compression for all subsequent field definitions.

**Return value**  
Returns SUCCEED(0) if successful or FAIL(-1) otherwise.

**Description**  
This routine sets the HDF field compression for subsequent swath field definitions. The compression does not apply to one-dimensional fields. The compression schemes currently supported is: deflate (gzip) (HE5_HDFE_COMP_DEFLATE=4) and no compression (HE5_HDFE_COMP_NONE = 0, the default). Deflate compression requires a single integer compression parameter in the range of one to nine with higher values corresponding to greater compression. Compressed fields are written using the standard `HE5_SWwritefield` routine, however, the entire field must be written in a single call. Any portion of a compressed field can then be accessed with the `HE5_SWreadfield` routine. Compression takes precedence over merging so that multi-dimensional fields that are compressed are not merged. The user should refer to the HDF Reference Manual for a fuller explanation of the compression schemes and parameters.

**Example**  
Suppose we wish to compress the Pressure using run length encoding, the Opacity field using deflate compression, the Spectra field with skipping Huffman compression, and use no compression for the Temperature field.

```c
status = HE5_SWdefcomp(swathID, HE5_HDFE_COMP_DEFLATE, NULL);

status = HE5_SWdefdatafield(swathID, "Pressure", "Track,Xtrack", NULL, H5T_NATIVE_FLOAT, 0);
compparm[0] = 5;
status = HE5_SWdefdatafield(swathID, "Opacity", "Track,Xtrack", NULL, H5T_NATIVE_FLOAT, 0);
```
status = HE5_SWdefdatafield(swathID, "Spectra", "Bands,Track,Xtrack", NULL, H5T_NATIVE_FLOAT, HDFE_NOMERGE);
status = HE5_SWdefcomp(swathID, HE5_HDFE_COMP_NONE, NULL);
status = HE5_SWdefdatafield(swathID, "Temperature", "Track,Xtrack", NULL, H5T_NATIVE_FLOAT, 0);

Note that the HE5_HDFE_AUTOMERGE/MERGE parameter is ignored in the Temperature field definition.

FORTRAN integer function he5_swdefcomp(swathid, compcode, compparm)
integer swathid
integer compcode
integer compparm(*)

The equivalent FORTRAN code for the example above is:

parameter (HE5_HDFE_NATIVE_FLOAT=1)
parameter (HE5_HDFE_COMP_NONE=0)
parameter (HE5_HDFE_COMP_DEFLATE=4)
integer compparm(5)
status = he5_swdefcomp(swathid, HE5_HDFE_COMP_DEFLATE, compparm);
status = he5_swdefdfld(swathid, "Pressure", "Xtrack,Track", " ", HE5_HDFE_NATIVE_FLOAT, 0);
compparm(1) = 5
status = he5_swdefdfld(swathid, "Opacity", "Xtrack,Track", " ", HE5_HDFE_NATIVE_FLOAT, 0);
status = he5_swdefdfld(swathid, "Spectra", "Xtrack,Track,Bands", " ", HE5_HDFE_NATIVE_FLOAT, 0)
status = he5_swdefcomp(swathid, HE5_HDFE_COMP_NONE, compparm)
status = he5_swdefdfld(swathid, "Temperature", "Xtrack,Track", " ", HE5_HDFE_NATIVE_FLOAT, 0)
Define a New Data Field within a Swath

**HE5_SWdefdatafield**

```c
herr_t HE5_SWdefdatafield(hid_t swathID, const char *fieldname, char *dimlist, char *maxdimlist, hid_t ntype, int merge)
```

- **swathID** (IN): Swath ID returned by HE5_SWcreate or HE5_SWattach
- **fieldname** (IN): Name of field to be defined
- **dimlist** (IN): The list of data dimensions defining the field
- **maxdimlist** (IN): The list of maximum data dimensions defining the field
- **ntype** (IN): The number type of the data stored in the field
- **merge** (IN): Merge code (HE5_HDFE_NOMERGE (0) - no merge, HE5_HDFE_AUTOMERGE (1) - merge)

**Note:** Merging is not supported in this release of the library. There are three illegal characters for field names: “/”, “;”, “,”.

**Purpose**
Defines a new data field within the swath.

**Return value**
Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reason for failure is unknown dimension in the dimension list.

**Description**
This routine defines geolocation fields to be stored in the swath. The dimensions are entered as a string consisting of geolocation dimensions separated by commas. They are entered in C order, that is, the last dimension is incremented first. The API will attempt to merge into a single object those fields that share dimensions and in case of multidimensional fields, numbertype.

**Example**
In this example, we define a three dimensional data field named *Spectra* with dimensions *Bands*, *DataTrack*, and *DataXtrack*:

```c
status = HE5_SWdefdatafield(swathID, "Spectra", "Bands,DataTrack,DataXtrack", "", H5T_NATIVE_FLOAT, 0);
```

**Note:** To assure that the fields defined by HE5_SWdefdatafield are properly established in the file, the swath should be detached (and then reattached) before writing to any fields.
integer swathid
character(*) filename
character(*) dimlist
character(*) maxdimlist
integer ntype
integer merge

The equivalent FORTRAN code for the example above is:

parameter (HE5_HDFE_NATIVE_FLOAT=1)
parameter (HE5_HDFE_AUTOMERGE=1)
status = he5_swdefdfld(swathid, "Spectra", "DataXtrack, DataTrack, Bands", " ", HE5_HDFE_NATIVE_FLOAT, 0)
Define a New Dimension within a Swath

**HE5_SWdefdim**

```c
herr_t HE5_SWdefdim(hid_t swathID, char *dimname, hsize_t dim)
```

- **swathID** IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **dimname** IN: Name of dimension to be defined
- **dim** IN: The size of the dimension

**Note:** There are three illegal characters for dimension names: “/”, “;”, “,”

**Purpose** Defines a new dimension within the swath.

**Return value** Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reason for failure is an improper swath ID.

**Description** This routine defines dimensions that are used by the field definition routines (described subsequently) to establish the size of the field.

**Example** In this example, we define a track geolocation dimension, GeoTrack, of size 2000, a cross track dimension, GeoXtrack, of size 1000 and two corresponding data dimensions with twice the resolution of the geolocation dimensions:

```c
status = HE5_SWdefdim(swathID, "GeoTrack", 2000);
status = HE5_SWdefdim(swathID, "GeoXtrack", 1000);
status = HE5_SWdefdim(swathID, "DataTrack", 4000);
status = HE5_SWdefdim(swathID, "DataXtrack", 2000);
status = HE5_SWdefdim(swathID, "Bands", 5);
```

To specify an unlimited dimension which can be used to define an appendable array, the dimension value should be set to -1 or equivalently, H5S_UNLIMITED:

```c
status = HE5_SWdefdim(swathID, "Unlim", H5S_UNLIMITED);
```

**FORTRAN**

```fortran
integer function he5_swdefdim(swathid, dimname, dim)
    integer swathid
    character(*) dimname
    integer*4 dim

The equivalent FORTRAN code for the first example above is:
```
dim    = 2000
status = he5_swdefdim(swathid, "GeoTrack", dim)

The equivalent FORTRAN code for the unlimited dimension example above is:

parameter (H5S_UNLIMITED=-1)
status = he5_swdefdim(swathid, "Unlim", H5S_UNLIMITED)
Define Mapping between Geolocation and Data Dimensions

HE5_SWdefdimmap

herr_t HE5_SWdefdimmap(hid_t swathID, char *geodim, char *datadim, hsize_t offset, hsize_t increment)

swathID IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
geodim IN: Geolocation dimension name
datadim IN: Data dimension name
offset IN: The offset of the geolocation dimension with respect to the data dimension
increment IN: The increment of the geolocation dimension with respect to the data dimension

Purpose Defines monotonic mapping between the geolocation and data dimensions.

Return value Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reason for failure is incorrect geolocation or data dimension name.

Description Typically the geolocation and data dimensions are of different size (resolution). This routine established the relation between the two where the offset gives the index of the data element (0-based) corresponding to the first geolocation element and the increment gives the number of data elements to skip for each geolocation element. If the geolocation dimension begins "before" the data dimension, then the offset is negative. Similarly, if the geolocation dimension has higher resolution than the data dimension, then the increment is negative.

Example In this example, we establish that (1) the first element of the GeoTrack dimension corresponds to the first element of the DataTrack dimension and the data dimension has twice the resolution as the geolocation dimension, and (2) the first element of the GeoXtrack dimension corresponds to the second element of the DataTrack dimension and the data dimension has twice the resolution as the geolocation dimension:

status = HE5_SWdefdimmap(swathID, "GeoTrack", "DataTrack", 0, 2);
status = HE5_SWdefdimmap(swathID, "GeoXtrack", "DataXtrack", 1, 2);

FORTRAN

integer function he5_swdefmap(swathid, geodim, datadim, offset, increment)

integer swathid
character(*) geodim
character(*) datadim
integer*4 offset
integer*4 increment

The equivalent FORTRAN code for the second example above is:

offset    = 0
increment = 2

status = he5_swdefmap(swathid, "GeoTrack", "DataTrack", offset, increment)

offset    = 1
increment = 2

status=he5_swdefmap(swathid,"GeoXtrack","DataXtrack",offset, increment)
Define a new Geolocation Field within a Swath

**HE5_SWdefgeofield**

```c
herr_t HE5_SWdefgeofield(hid_t swathID, const char *fieldname, char *dimlist, char *maxdimlist, hid_t ntype, int merge)
```

- **swathID** IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **fieldname** IN: Name of field to be defined
- **dimlist** IN: The list of geolocation dimensions defining the field
- **maxdimlist** IN: The maximum dimension list of geolocation dimensions defining the field
- **ntype** IN: The number type of the data stored in the field
- **merge** IN: Merge code (HE5_HDFE_NOMERGE (0) - no merge, HE5_HDFE_AUTOMERGE(1) - merge

**Note:** Merging is not supported in this release of the library. There are three illegal characters for field names: “/”, “;”, “,”

**Purpose** Defines a new geolocation field within the swath.

**Return value** Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reason for failure is unknown dimension in the dimension list.

**Description** This routine defines geolocation fields to be stored in the swath. The dimensions are entered as a string consisting of geolocation dimensions separated by commas. They are entered in C order, that is, the last dimension is incremented first. The API will attempt to merge into a single object those fields that share dimensions and in case of multidimensional fields, numbertype. Two and three dimensional fields will be merged into a single three-dimensional object if the last two dimensions (in C order are equal). If the merge code for a field is set to 0, the API will not attempt to merge it with other fields. Fields using the unlimited dimension will not be merged.

**Example** In this example, we define the geolocation fields, *Longitude* and *Latitude* with dimensions *GeoTrack* and *GeoXtrack* and containing 4 byte floating point numbers. We allow these fields to be merged into a single object:

```c
status = HE5_SWdefgeofield(swathID, "Longitude",
   "GeoTrack,GeoXtrack", NULL, H5T_NATIVE_FLOAT, 0);
```
status = HE5_SWdefgeofield(swathID, "Latitude",
   "GeoTrack,GeoXtrack", NULL, H5T_NATIVE_FLOAT,
   HE5_HDFE_NOMERGE);

Note: To assure that the fields defined by HE5_SWdefgeofield are properly established in the file, the swath should be detached (and then reattached) before writing to any fields.

FORTRAN

integer function he5_swdefgfld(swathid, fieldname, dimlist, maxdimlist, ntype, merge)

integer swathid
character(*) fieldname
character(*) dimlist
character(*) maxdimlist
integer ntype
integer merge

The equivalent FORTRAN code for the first example above is:

parameter (HE5_HDFE_NATIVE_FLOAT=1)
parameter (HE5_HDFE_NOMERGE=0)

status=he5_swdefgfld(swathid,"Longitude","GeoXtrack,GeoTrack ", " ", HE5_HDFE_NATIVE_FLOAT, HE5_HDFE_NOMERGE)

The dimensions are entered in FORTRAN order with the first dimension incremented first.
Define Indexed Mapping between Geolocation and Data Dimension

**HE5_SWdefidxmap**

```c
herr_t HE5_SWdefidxmap(hid_t swathID, char *geodim, char *datadim, long index[]),
```

- **swathID** IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **geodim** IN: Geolocation dimension name
- **datadim** IN: Data dimension name
- **index** IN: The array containing the indices of the data dimension to which each geolocation element corresponds.

**Purpose** Defines a non-regular mapping between the geolocation and data dimension.

**Return value** Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reason for failure is incorrect geolocation or data dimension name.

**Description** If there does not exist a regular (linear) mapping between a geolocation and data dimension, then the mapping must be made explicit. Each element of the index array, whose dimension is given by the geolocation size, contains the element number (0-based) of the corresponding data dimension.

**Example** In this example, we consider the (simple) case of a geolocation dimension, `IdxGeo` of size 5 and a data dimension `IdxData` of size 8.

```c
long index[5] = {0,2,3,6,7};
status = HE5_SWdefidxmap(swathID, "IdxGeo", "IdxData", index);
```

In this case the 0th element of `IdxGeo` will correspond to the 0th element of `IdxData`, the 1st element of `IdxGeo` to the 2nd element of `IdxData`, etc.

**FORTRAN**

```fortran
integer function he5_swdefimap(swathid, geodim, datadim, index)
  integer swathid
  character(*) geodim
  character(*) datadim
  integer(*) index

The equivalent FORTRAN code for the example above is:

```c
status = he5_swdefimap(swathid, "IdxGeo", "IdxData", index)"
# Define a Time Period of Interest

**HE5_SWdeftimeperiod**

hid_t HE5_SWdeftimeperiod(hid_t swathID, double starttime, double stoptime, int mode)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>swathID</td>
<td>Swath ID returned by HE5_SWcreate or HE5_SWattach</td>
</tr>
<tr>
<td>starttime</td>
<td>Start time of period</td>
</tr>
<tr>
<td>stoptime</td>
<td>Stop time of period</td>
</tr>
<tr>
<td>mode</td>
<td>Cross Track inclusion mode</td>
</tr>
</tbody>
</table>

**Purpose**
Defines a time period for a swath.

**Return value**
Returns the swath period ID if successful or FAIL (-1) otherwise.

**Description**
This routine defines a time period for a swath. It returns a swath period ID which is used by the *HE5_SWextractperiod* routine to read all the entries of a data field within the time period. A cross track is within a time period if 1) its midpoint is within the time period "box", or 2) either of its endpoints is within the time period "box", or 3) any point of the cross track is within the time period "box", depending on the inclusion mode designated by the user. All elements within an included cross track are considered to be within the time period even though a particular element of the cross track might be outside the time period. The swath structure must have the *Time* field defined.

**Example**
In this example, we define a time period with a start time of 35232487.2 and a stop time of 36609898.1. We will consider a cross track to be within the time period if either one of the time values at the endpoints of a cross track are within the time period.

```c
starttime = 35232487.2;
stoptime = 36609898.1;
periodID = HE5_SWdeftimeperiod(swathID, starttime, stoptime, HE5_HDFE_ENDPOINT);
```
FORTRAN

integer function he5_swdeftmeper(swathid, starttime, stoptime, mode)

integer swathid
real*8 starttime
real*8 stoptime
integer mode

The equivalent FORTRAN code for the example above is:

parameter (HE5_HDFE_ENDPOINT=1)

starttime = 35232487.2
stoptime = 36609898.1

periodID = he5_swdeftmeper(swathID, starttime, stoptime, HE5_HDFE_ENDPOINT)
Define a Vertical Subset Region

HE5_SWdefvrtrgion

hid_t HE5_SWdefvrtrgion(hid_t swathID, hid_t regionID, char *vertObj, double range[])

- **swathID** IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **regionID** IN: Region (or period) id from previous subset call
- **vertObj** IN: Dimension or field to subset by
- **range** IN: Minimum and maximum range for subset

**Purpose** Subsets on a **monotonic** field or contiguous elements of a dimension.

**Return value** Returns the swath region ID if successful or FAIL (-1) otherwise.

**Description** Whereas the *HE5_SWdefboxregion* and *HE5_SWdeftimeperiod* routines perform subsetting along the “Track” dimension, this routine allows the user to subset along any dimension. The region is specified by a set of minimum and maximum values and can represent either a dimension index (case 1) or field value range (case 2). In the second case, the field must be one-dimensional and the values must be **monotonic** (strictly increasing or decreasing) in order that the resulting dimension index range be contiguous. (For the current version of this routine, the second option is restricted to fields with number type: INT, LONG, FLOAT, DOUBLE.)

This routine may be called after *HE5_SWdefboxregion* or *HE5_SWdeftimeperiod* to provide both geographic or time and “vertical” subsetting. In this case the user provides the id from the previous subset call. (This same id is then returned by the function.) This routine may also be called “stand-alone” by setting the region ID to HE5_HDFE_NOPREVSUB (-1).

This routine may be called up to eight times with the same region ID. It this way a region can be subsetted along a number of dimensions.

The *HE5_SWregioninfo* and *HE5_SWextractregion* routines work as before, however because there is no mapping performed between geolocation dimensions and data dimensions the field to be subsetted, (the field specified in the call to *HE5_SWregioninfo* and *HE5_SWextractregion*) must contain the dimension used explicitly in the call to *HE5_SWdefvrtrgion* (case 1) or the dimension of the one-dimensional field (case 2).
Example Suppose we have a field called *Pressure* of dimension *Height (= 10)* whose values increase from 100 to 1000. If we desire all the elements with values between 500 and 800, we make the call:

```c
range[0] = 500.;
range[1] = 800.;
regionID = HE5_SWdefvtregion(swathID, HE5_HDFE_NOPREVSUB, "Pressure", range);
```

The routine determines the elements in the *Height* dimension which correspond to the values of the *Pressure* field between 500 and 800.

If we wish to specify the subset as elements 2 through 5 (0-based) of the *Height* dimension, the call would be:

```c
range[0] = 2;
range[1] = 5;
regionID = HE5_SWdefvtregion(swathID, HE5_HDFE_NOPREVSUB, "DIM:Height", range);
```

The “DIM:” prefix tells the routine that the range corresponds to elements of a dimension rather than values of a field.

In this example, any field to be subsetted must contain the *Height* dimension.

If a previous subset region or period was defined with id, *subsetID*, that we wish to refine further with the vertical subsetting defined above we make the call:

```c
regionID = HE5_SWdefvtregion(swathID, subsetID, "Pressure", range);
```

The return value, *regionID* is set equal to *subsetID*. That is, the subset region is modified rather than a new one created.

We can further refine the subset region with another call to the routine:

```c
freq[0] = 1540.3;
freq[1] = 1652.8;
regionID = HE5_SWdefvtregion(swathID, regionID, "FreqRange", freq);
```
FORTRAN

integer function he5_swdefvrtreg(swathid, regionid, vertobj, range)

integer swathid
integer regionid
character(*) vertobj
real*8 range(*)

The equivalent FORTRAN code for the examples above is:

parameter (HE5_HDFE_NOPREVSUB=-1)
range(1) = 500.
range(2) = 800.
regionid = he5_swdefvrtreg(swathid, HE5_HDFE_NOPREVSUB, "Pressure", range)
Detach from a Swath Structure

**HE5_SWdetach**

herr_t HE5_SWdetach(hid_t swathID)

- **swathID** IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **Purpose** Detaches from swath interface.
- **Return value** Returns SUCCEED (0) if successful or FAIL (-1) otherwise.
- **Description** This routine should be run before exiting from the swath file for every swath opened by HE5_SWcreate or HE5_SWattach.
- **Example** In this example, we detach the swath structure, *ExampleSwath*:

  ```c
  status = HE5_SWdetach(swathID);
  ```

**FORTRAN** integer function he5_swdetach(swathid)

- integer swathid

  The equivalent FORTRAN code for the example above is:

  ```fortran
  status = he5_swdetach(swathid)
  ```
Retrieve Size of Specified Dimension

HE5_SWdiminfo

hsizet HE5_SWdiminfo(hid_t swathID, char *dimname)

swathID IN: Swath ID returned by HE5_SWcreate or HE5_SWattach

dimname IN: Dimension name

Purpose Retrieve size of specified dimension.

Return value Size of dimension if successful or FAIL (-1) otherwise. If -1, could signify an improper swath ID or dimension name.

Description This routine retrieves the size of specified dimension.

Example In this example, we retrieve information about the dimension, "GeoTrack":

dimsize = HE5_SWdiminfo(swathID, "GeoTrack");

The return value, dimsize, will be equal to 2000.

FORTRAN integer*4 function he5_swdiminfo(swathid, dimname)

integer swathid

character(*) dimname

integer*4 dimsize

The equivalent FORTRAN code for the example above is:

dimsize = he5_swdiminfo(swathid, "GeoTrack")
Remove an Alias for Swath Data Field

**HE5_SWdropalias**

```c
herr_t HE5_SWdropalias(hid_t swathID, int fldgroup, const char *aliasname)
```

- **swathID**  
  **IN:** Swath ID returned by HE5_SWcreate or HE5_SWattach

- **fldgroup**  
  **IN:** Field group flag

- **aliasname**  
  **IN:** Name of alias to remove

**Purpose**  
Remove an alias for Swath data field

**Return value**  
Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

**Description**  
Removes alias associated with a Swath data field.

**Example**  
In this example, we create and alias for the data field *Temperature*.

```c
strcpy(aliasname, "temps 0 to 30");
status = HE5_SWdropalias(swathID, HE5_HDFE_DATAGROUP, aliasname);
```

**FORTRAN**

```fortran
integer function he5_swdropalias (swathid, fldgroup, aliasname)
  integer swathid
  character(*) fldgroup
  character(*) aliasname
```

The equivalent **FORTRAN** code for the first example above is:

```fortran
aliasname = "temps 0 to 30"
status = he5_swdropalias(swathid, HE5_HDFE_DATAGROUP, aliasname)
```
Duplicate a Region or Period

**HE5_SWDupregion**

hid_t HE5_SWDupregion(hid_t *regionID)

| regionID | IN: | Region or period ID returned by HE5_SWdefboxregion, HE5_SWdeftimeperiod, or HE5_SWdefvrtregion. |
| Purpose  |     | Duplicates a region. |
| Return value |     | Returns new region or period ID if successful or FAIL (-1) otherwise. |
| Description |     | This routine copies the information stored in a current region or period to a new region or period and generates a new id. It is usefully when the user wishes to further subset a region (period) in multiple ways. |
| Example |     | In this example, we first subset a swath with `HE5_SWdefboxregion`, duplicate the region creating a new region ID, `regionID2`, and then perform two different vertical subsets of these (identical) geographic subset regions: |

```plaintext
regionID = HE5_SWdefboxregion(swathID, cornerlon, cornerlat, HE5_HDFE_MIDPOINT);
regionID2 = HE5_SWDupregion(regionID);
regionID = HE5_SWdefvrtregion(swathID, regionID, "Pressure", rangePres);
regionID2 = HE5_SWdefvrtregion(swathID, regionID2, "Temperature", rangeTemp);
```

**FORTRAN**

integer he5_swdupreg(regionid)

```plaintext
integer regionid

The equivalent FORTRAN code for the example above is:

parameter (HE5_HDFE_MIDPOINT=0)
regionid = he5_swdefboxreg(swathid, cornerlon, cornerlat, HE5_HDFE_MIDPOINT)
regionid2 = he5_swdupreg(regionid)
regionid = he5_swdefvrtreg(swathid, regionid, 'Pressure', rangePres)
regionid2 = he5_swdefvrtreg(swathid, regionid2, 'Temperature', rangeTemp)
```
Read Data from a Defined Time Period

**HE5_SWextractperiod**

```c
herr_t HE5_SWextractperiod(hid_t swathID, hid_t periodID, char *fieldname, int externalflag, void *buffer)
```

- **swathID** IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **periodID** IN: Period id returned by HE5_SWdeftimeperiod
- **fieldname** IN: Field to subset
- **externalflag** IN: External geolocation mode
- **buffer** OUT: Data buffer

**Purpose** Extracts (reads) from subsetted time period.

**Return value** Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

**NOTE:** External file functionality not available in this release

**Description** This routine reads data into the data buffer from the subsetted time period. Only complete crosstracks are extracted. If the external_mode flag is set to `HE5_HDFE_EXTERNAL` (1) then the geolocation fields and the data field can be in different swaths. If set to `HE5_HDFE_INTERNAL` (0), then these fields must be in the same swath structure.

**Example** In this example, we read data within the subsetted time period defined in `HE5_SWdeftimeperiod` from the Spectra field. Both the geolocation fields and the Spectra data field are in the same swath.

```c
status = HE5_SWextractperiod(SwathID, periodID, "Spectra", HE5_HDFE_INTERNAL, datbuf);
```

**FORTRAN**

```fortran
integer function he5_swextper(swathID, periodid, fieldname, externalflag, buffer)
    integer swathID
    integer periodid
    character(*) fieldname
    integer externalflag
    <valid type> buffer(*)
```

2-77 175-TP-511-003
The equivalent *FORTRAN* code for the example above is:

```fortran
parameter (HE5_HDFE_INTERNAL=0)

status = he5_swextper(swathid, periodid, "Spectra",
HE5_HDFE_INTERNAL, datbuf)
```
Read Data from a Geographic Region

HE5_SWextractregion

herr_t HE5_SWextractregion(hid_t swathID, hid_t regionID, char *fieldname, int externalflag, void *buffer)

- **swathID**
  - **IN:** Swath ID returned by HE5_SWcreate or HE5_SWattach

- **regionID**
  - **IN:** Region ID returned by HE5_SWdefboxregion

- **fieldname**
  - **IN:** Field to subset

- **externalflag**
  - **IN:** External geolocation mode

- **buffer**
  - **OUT:** Data buffer

**Purpose**
Extracts (reads) from subsetted region.

**Return value**
Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

**NOTE:** External file functionality not available in this release

**Description**
This routine reads data into the data buffer from the subsetted region. Only complete crosstracks are extracted. If the external_mode flag is set to `HE5_HDFE_EXTERNAL` (1) then the geolocation fields and the data field can be in different swaths. If set to `HE5_HDFE_INTERNAL` (0), then these fields must be in the same swath structure.

**Example**
In this example, we read data within the subsetted region defined in HE5_SWdefboxregion from the *Spectra* field. Both the geolocation fields and the *Spectra* data field are in the same swath.

```c
status = HE5_SWextractregion(SWid, regionID, "Spectra", HE5_HDFE_INTERNAL, datbuf);
```

**FORTRAN**
integer function he5_swextreg(swathid, regionid, fieldname, externalflag, buffer)

- **integer** `swathid`
- **integer** `regionid`
- **character(*)** `fieldname`
- **integer** `externalflag`
- `<valid type>` `buffer(*)`

The equivalent FORTRAN code for the example above is:
parameter (HE5_HDFE_INTERNAL=0)

status = he5_swextreg(swathid, regionid, "Spectra",
HE5_HDFE_INTERNAL, datbuf)
Retrieve Information about a Swath Field

**HE5_SWfieldinfo**

```c
herr_t HE5_SWfieldinfo(hid_t swathID, char *fieldname, int *rank, hsize_t dims[], H5T_class_t ntype[], char *dimlist, char *maxdimlist)
```

- **swathID** IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **fieldname** IN: Fieldname
- **rank** OUT: Rank of field
- **dims** OUT: Array containing the dimension sizes of the field
- **ntype** OUT: Array containing the numbertype of the field
- **dimlist** OUT: List of dimensions in field
- **maxdimlist** OUT: List of maximum dimensions in field

**Purpose**
Retrieve information about a specific geolocation or data field in the swath.

**Return value**
Returns SUCCEED (0) if successful or FAIL (-1) otherwise. A typical reason for failure is the specified field does not exist.

**Description**
This routine retrieves information on a specific data field.

**Example**
In this example, we retrieve information about the Spectra data fields:

```c
status = HE5_SWfieldinfo(swathID, "Spectra", &rank, dims, numbertype, dimlist, maxdimlist);
```

The return parameters will have the following values:

```c
rank=3, numbertype=5, dims[3]={5,4000,2000} and dimlist="Bands, DataTrack, DataXtrack"
```

If one of the dimensions in the field is appendable, then the current value for that dimension will be returned in the **dims** array.
FORTRAN    integer function he5_swfldinfo(swathid, fieldname, rank, dims, ntype, dimlist, maxdimlist)

    integer swathid
    character(*) fieldname
    integer rank
    integer*4 dims(*)
    integer ntype(*)
    character(*) dimlist
    character(*) maxdimlist

The equivalent FORTRAN code for the example above is:

    status = he5_swfldinfo(swathid, "Spectra", rank, dims, numbertype, dimlist, maxdimlist)

The return parameters will have the following values:

    rank=3, numbertype=5, dims[3]={2000,4000,5} and dimlist="DataXtrack, DataTrack,Bands"

Note that the dimensions array and dimension list are in FORTRAN order.
Rename Swath Data Field

**HE5_SWfldrename**

```c
herr_t HE5_SWfldrename(hid_t swathID, char *oldfieldname, const char *newfieldname)
```

- **swathID** (IN): Swath ID returned by HE5_SWcreate or HE5_SWattach
- **oldfieldname** (IN): Current name of field
- **newfieldname** (IN): New name of field

**Purpose**: Rename swath data field

**Return value**: Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

**Description**: This function allows the user to change the name of a field. This is useful in case the user would want to update the data field to reflect a version change in the calibration of a data field and show that in the name of the field.

**Example**: In this example, we create and alias for the data field `Temperature`.

```c
strcpy(newfieldname, "temps 0 to 30");

status = HE5_SWfldrename(swathID, "Temperature", newfieldname);
```

**FORTRAN**

```fortran
integer function he5_swfldrename (swathid, oldfieldname, newfieldname)
integer swathid
character(*) oldfieldname
character(*) newfieldname
```

The equivalent **FORTRAN** code for the first example above is:

```fortran
newfieldname = "temps 0 to 30"

status = he5_swfldrename(swathid, "Temperature", newfieldname)
```
Get External Data File Information

**HE5_SWgetextdata**

```c
int HE5_SWgetextdata(hid_t swathID, char *fieldname, size_t namelength, char *filelist, off_t offset[], hsize_t size[])
```

- `swathID` **IN:** Swath ID returned by HE5_SWcreate or HE5_SWattach
- `fieldname` **IN:** External field name
- `namelength` **OUT:** Length of each name entry
- `filelist` **OUT:** List of file names
- `offset[]` **OUT:** Array of offsets (in byte) from the beginning of file to the location in file where the data starts
- `size[]` **OUT:** Array of sizes (in bytes) reserved in the file for the data

**Purpose**
Retrieves information about external data file(s) associated with the data set.

**Return value**
Returns number of external data files if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper swath ID or field name.

**Example**
In this example, we get information about the ExtData field:

```c
nfiles = HE5_SWgetextdata(swathID, "ExtData", namlen, filenames, offset, size);
```

**FORTRAN**

```fortran
integer function he5_swgetxdat(swathid,fieldname,nlen, fllist,offset, size)
  integer swathid
  integer nfiles
  integer*4 nlen
  integer*4 offset(*)
  integer*4 size(*)
  character(*) filename
  character(*) flist
```

The equivalent **FORTRAN** code for the example above is:

```fortran
nfiles = he5_swgetxdat(swathid, "ExtData", nlen, fllist, offset, size)
```
Get Fill Value for a Specified Field

HE5_SWgetfillvalue

herr_t HE5_SWgetfillvalue(hid_t swathID, char *fieldname, void *fillval)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>swathID</td>
<td>Swath ID returned by HE5_SWcreate or HE5_SWattach</td>
</tr>
<tr>
<td>fieldname</td>
<td>Fieldname</td>
</tr>
<tr>
<td>fillval</td>
<td>Space allocated to store the fill value</td>
</tr>
</tbody>
</table>

Purpose
Retrieves fill value for the specified field.

Return value
Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper swath id or number type.

Description
It is assumed the number type of the fill value is the same as the field.

Example
In this example, we get the fill value for the Temperature field:

```c
status = HE5_SWgetfillvalue(swathID, "Temperature", &tempfill);
```

FORTRAN

```fortran
integer function he5_swgetfill(swathid,fieldname,fillval)
integer swathid
character(*) fieldname
<valid type> fillval(*)
```

The equivalent FORTRAN code for the example above is:

```fortran
status = he5_swgetfill(swathid, "Temperature", tempfill)
```
Retrieve Type of Dimension Mapping when first Dimension is Geodim

HE5_SWgeomapinfo

herr_t HE5_SWgeomapinfo(hid_t swathID, char *geodim)

- **swathID** IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **geodim** IN: Dimension name

**Purpose** Retrieve type of dimension mapping for a dimension.

**Return value** Returns (2) for indexed mapping, (1) for regular mapping, (0) if dimension is not mapped, or FAIL (-1) otherwise.

**Description** This routine checks the type of mapping (regular or indexed).

**Example** In this example, we retrieve information about the type of mapping between the “IdxGeo” and “IdxData” dimensions, defined by HE5_SWdefidxmap.

```fortran
status = HE5_SWgeomapinfo(swathID, geodim);
```

We will have regmap = 2 for indexed mapping between the “IdxGeo” and “IdxData” dimensions.

**NOTE:** If the dimension has regular mapping and indexed, the function will return a value of 3.

**FORTRAN**

```fortran
integer function he5_swgmapinfo(swathid, geodim)
integer swathid
character*(*) geodim
```

The equivalent **FORTRAN** code for the example above is:

```fortran
status = he5_swgmapinfo(swathid, geodim)
```
Return Information about a Group Swath Attribute

**HE5_SWgrpattrinfo**

definition of function:
```
he5_swgrpattrinfo(hid_t swathID, const char *attrname, H5T_class_t *ntype, hsize_t *count)
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>swathID</td>
<td>IN: Swath ID returned by HE5_SWcreate or HE5_SWattach</td>
</tr>
<tr>
<td>attrname</td>
<td>IN: Attribute name</td>
</tr>
<tr>
<td>ntype</td>
<td>OUT: Data type class ID of attribute</td>
</tr>
<tr>
<td>count</td>
<td>OUT: Number of attribute elements</td>
</tr>
</tbody>
</table>

**Purpose**
Returns information about a swath group attribute.

**Return value**
Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

**Description**
This routine returns number type and number of elements (count) of a swath group attribute.

**Example**
In this example, we return information about the *ScalarFloat* attribute.

```
status = HE5_SWgrpattrinfo(swathID, "ScalarFloat", &nt, &count);
```

The `nt` variable will have the value 1 and `count` will have the value 1.

**FORTRAN**
```
integer function he5_swgattrinfo(swathid, attrname, ntype, count)
integer swathid
character(*) attrname
integer ntype
integer *4 count
```

The equivalent FORTRAN code for the first example above is:

```
status = he5_swgattrinfo(swathid, "ScalarFloat", nt, count)
```
Retrieve Indexed Geolocation Mapping

**HE5_SWidxmapinfo**

```c
hsizet HE5_SWidxmapinfo(hid_t swathID, char *geodim, char *datadim, long index[])
```

### Parameters

- **swathID**
  - **IN:** Swath ID returned by HE5_SWcreate or HE5_SWattach

- **geodim**
  - **IN:** Indexed Geolocation dimension name

- **datadim**
  - **IN:** Indexed Data dimension name

- **index**
  - **OUT:** Index mapping array

### Purpose
Retrieve indexed array of specified geolocation mapping.

### Return value
Returns size of indexed array if successful or FAIL (-1) otherwise. A typical reason for failure is the specified mapping does not exist.

### Description
This routine retrieves the size of the indexed array and the array of indexed elements of the specified geolocation mapping.

### Example
In this example, we retrieve information about the indexed mapping between the "IdxGeo" and "IdxData" dimensions:

```c
idxsz = HE5_SWidxmapinfo(swathID, "IdxGeo", "IdxData", index);
```

The variable, `idxsz`, will be equal to 5 and `index[5] = {0,2,3,6,7}`.

### FORTRAN

```fortran
integer*4 function he5_swimapinfo(swathid, geodim, datadim, index)
integer swathid
character(*) geodim
character(*) datadim
integer*4 index(*)
```

The equivalent FORTRAN code for the example above is:

```fortran
idxsz = he5_swimapinfo(swathid, "IdxGeo", "IdxData", index)
```
Retrieve Information Swath Attributes

HE5_SWinqattrs

long HE5_SWinqattrs(hid_t swathID, char *attrnames, long *strbufsize)

swathID IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
attrnames OUT: Attribute list (entries separated by commas)
strbufsize OUT: String length of attribute list

Purpose
Retrieve information about attributes defined in swath.

Return value
Number of attributes found if successful or FAIL (-1) otherwise.

Description
The attribute list is returned as a string with each attribute name separated by commas. If attrlist is set to NULL, then the routine will return just the string buffer size, strbufsize. This variable does not count the null string terminator.

Example
In this example, we retrieve information about the attributes defined in a swath structure. We assume that there are two attributes stored, attrOne and attr_2:

nattr = HE5_SWinqattrs(swathID, NULL, &strbufsize);
The parameter, nattr, will have the value 2 and strbufsize will have value 14.

nattr = HE5_SWinqattrs(swathID, attrnames, &strbufsize);
The variable, attrnames, will be set to:
"attrOne,attr_2".

FORTRAN
integer*4 function he5_swinqattrs(swathid,attrnames,strbufsize)
integer swathid
character(*) attrnames
integer*4 strbufsize
The equivalent FORTRAN code for the example above is:

nattr = he5_swinqattrs(swathid, attrnames, strbufsize)
Retrieve Information about Data Fields Defined in Swath

**HE5_SWinqdatafields**

```c
long HE5_SWinqdatafields(hid_t swathID, char *fieldlist, int rank[], H5T_class_t ntype[])
```

- **swathID**  
  IN: Swath ID returned by HE5_SWcreate or HE5_SWattach

- **fieldlist**  
  OUT: Listing of data fields (entries separated by commas)

- **rank**  
  OUT: Array containing the rank of each data field

- **ntype**  
  OUT: Array containing the numbertype of each data field

**Purpose**
Retrieve information about all of the data fields defined in swath.

**Return value**
Number of data fields found if successful or FAIL (-1) otherwise. A typical reason for failure is an improper swath id.

**Description**
The field list is returned as a string with each data field separated by commas. The `rank` and `ntype` arrays will have an entry for each field. Output parameters set to `NULL` will not be returned.

**Example**
In this example we retrieve information about the data fields:

```c
nflds = HE5_SWinqdatafields(swathID, fieldlist, rank, ntype);
```

The parameter, `fieldlist`, will have the value:

**FORTRAN**
integer*4 function he5_swinqdflds(swathid, fieldlist, rank, ntype)

```fortran
integer swathid
character(*) fieldlist
integer rank(*)
integer ntype(*)
```

The equivalent FORTRAN code for the example above is:

```fortran
nflds = he5_swinqdflds(swathid, fieldlist, rank, ntype)
```
Retrieve Information about Dimensions Defined in Swath

HE5_SWinqdims

long HE5_SWinqdims(hid_t swathID, char *dimnames, hsize_t dims[])

- **swathID**
  - IN: Swath ID returned by HE5_SWcreate or HE5_SWattach

- **dimnames**
  - OUT: Dimension list (entries separated by commas)

- **dims**
  - OUT: Array containing size of each dimension

**Purpose**
Retrieve information about all of the dimensions defined in swath.

**Return value**
Number of dimension entries found if successful or FAIL (-1) otherwise. A typical reason for failure is an improper swath id.

**Description**
The dimension list is returned as a string with each dimension name separated by commas. Output parameters set to **NULL** will not be returned.

**Example**
In this example, we retrieve information about the dimensions defined in the *ExampleSwath* structure:

```c
ndims = HE5_SWinqdims(swathID, dimnames, dims);
```

The parameter, *dimname*, will have the value:

"*GeoTrack,GeoXtrack,DataTrack,DataXtrack,Bands,Unlim*"

with \( ndims = 6, \) \( dims[6] =\{2000,1000,4000,2000,5,0\} \)

**FORTRAN**
integer*4 function he5_swinqdims(swathid, dimnames, dims)

```fortran
    integer swathid
    character(*) dimnames
    integer*4 dims(*)
```

The equivalent **FORTRAN** code for the example above is:

```fortran
ndims = he5_swinqdims(swathid, dimnames, dims)
```
Retrieve Information about Geolocation Fields Defined in Swath

**HE5_SWinqgeofields**

```c
long HE5_SWinqgeofields(hid_t swathID, char *fieldlist, int rank[], H5T_class_t ntype[])
```

- **swathID** IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **fieldlist** OUT: Listing of geolocation fields (entries separated by commas)
- **rank** OUT: Array containing the rank of each geolocation field
- **ntype** OUT: Array containing the numbertype of each geolocation field

**Purpose** Retrieve information about all of the geolocation fields defined in swath.

**Return value** Number of geolocation fields found if successful or FAIL (-1) otherwise. A typical reason for failure is an improper swath id.

**Description** The field list is returned as a string with each geolocation field separated by commas. The `rank` and `ntype` arrays will have an entry for each field. Output parameters set to `NULL` will not be returned.

**Example** In this example, we retrieve information about the geolocation fields:

```c
nflds = HE5_SWinqgeofields(swathID, fieldlist, rank, ntype);
```

The parameter, `fieldlist`, will have the value: "Longitude,Latitude" with `nflds = 2, rank[2]={2,2}, ntype[2]={1,1}`

**FORTRAN**

```fortran
integer*4 function he5_swinqgflds(swathid, fieldlist, rank, ntype)
integer swathid
character(*) fieldlist
integer rank(*)
integer ntype(*)
```

The equivalent FORTRAN code for the example above is:

```fortran
nflds = he5_swinqgflds(swathid, fieldlist, rank, ntype)
```
Retrieve Information about Swath Group Attributes

HE5_SWinqgrpattrs

long HE5_SWinqgrpattrs(hid_t swathID, char *attrnames, long *strbufsize)

swathID IN: Swath ID returned by HE5_SWcreate or HE5_SWattach

attrnames OUT: Attribute list (entries separated by commas)

strbufsize OUT: String length of attribute list

Purpose Retrieve information about group attributes defined in swath.

Return value Number of attributes found if successful or FAIL (-1) otherwise.

Description The attribute list is returned as a string with each group attribute name separated by commas. If attrlist is set to NULL, then the routine will return just the string buffer size, strbufsize. This variable does not count the null string terminator.

Example In this example, we retrieve information about the group attributes defined for the “Data Fields” group. We assume that there are two attributes stored, attrOne and attr_2:

```
nattr = HE5_SWinqgrpattrs(swathID, NULL, &strbufsize);
```

The parameter, nattr, will have the value 2 and strbufsize will have value 14.

```
nattr = HE5_SWinqgrpattrs(swathID, attrnames, &strbufsize);
```

The variable, attrnames, will be set to:

"attrOne,attr_2".

FORTRAN integer*4 function he5_swinqgattrs(swathid, attrnames, strbufsize)

integer swathid
character*(*) attrnames
integer*4 strbufsize
integer*4 nattr

The equivalent FORTRAN code for the example above is:

```
nattr = he5_swinqgattrs(swathid, attrnames, strbufsize)
```
Retrieve Information about Indexed Mappings Defined in Swath

HE5_SWinqidxmaps

long HE5_SWinqidxmaps(hid_t swathID, char *idxmap, hsize_t idxsizes[])

swathID  IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
idxmap  OUT: Indexed Dimension mapping list (entries separated by commas)
idxsizes  OUT: Array containing the sizes of the corresponding index arrays.
Purpose Retrieve information about all of the indexed geolocation/data mappings defined in swath.

Return value Number of indexed mapping relations found if successful or FAIL (-1) otherwise. A typical reason for failure is an improper Swath ID.

Description The dimension mapping list is returned as a string with each mapping separated by commas. The two dimensions in each mapping are separated by a slash (/). Output parameters set to NULL, will not be returned.

Example In this example, we retrieve information about the indexed dimension mappings:

nidxmaps = HE5_SWinqidxmaps(swathID, idxmap, idxsizes);
The variable, idxmap, will contain the string:
"IdxGeo/IdxData" with nidxmaps = 1 and idxsizes[1] = {5}.

FORTRAN integer*4 function he5_swinqimaps(swathid, dimmap, idxsizes)

integer swathid
character(*) dimmap
integer*4 idxsizes(*)
The equivalent FORTRAN code for the example above is:

nidxmaps = he5_swinqimaps(swathid, dimmap, idxsizes)
Retrieve Information Swath Local Attributes

HE5_SWinqlocattrs

long HE5_SWinqlocattrs(hid_t swathID, const char *fieldname, char *attrnames, long *strbufsize)

swathID IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
fieldname IN: Fieldname to retrieve local attribute information
attrnames OUT: Attribute list (entries separated by commas)
strbufsize OUT: String length of attribute list

Purpose Retrieve information about local attributes defined for a field.

Return value Number of attributes found if successful or FAIL (-1) otherwise.

Description The attribute list is returned as a string with each local attribute name separated by commas. If attrlist is set to NULL, then the routine will return just the string buffer size, strbufsize. This variable does not count the null string terminator.

Example In this example, we retrieve information about the local attributes defined for a field “DataField”. We assume that there are two attributes stored, attrOne and attr_2:

nattr = HE5_SWinqlocattrs(swathID, “DataField”, NULL, &strbufsize);

The parameter, nattr, will have the value 2 and strbufsize will have value 14.

nattr = HE5_SWinqlocattrs(swathID, “DataField”, attrnames, &strbufsize);

The variable, attrlist, will be set to: ’”attrOne,attr_2”’.

FORTRAN integer*4 function he5_swinqlattrs(swathid, fieldname, attrnames, strbufsize)
integer swathid
character(*) fieldname
character(*) attrnames
The equivalent _FORTRAN_ code for the example above is:

```fortran
nattr = he5_swinqattrs(swathid, "DataField", attrnames, strbufsize)
```
Retrieve Information about Dimension Mappings
Defined in Swath

**HE5_SWinqmaps**

long HE5_SWinqmaps(hid_t swathId, char *dimmap, long offset[], long increment[])

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>swathID</td>
<td>IN: Swath ID returned by HE5_SWcreate or HE5_SWattach</td>
</tr>
<tr>
<td>dimmap</td>
<td>OUT: Dimension mapping list (entries separated by commas)</td>
</tr>
<tr>
<td>offset</td>
<td>OUT: Array containing the offset of each geolocation relation</td>
</tr>
<tr>
<td>increment</td>
<td>OUT: Array containing the increment of each geolocation relation</td>
</tr>
</tbody>
</table>

**Purpose**
Retrieve information about all of the (non-indexed) geolocation relations defined in swath.

**Return value**
Number of geolocation relation entries found if successful or FAIL (-1) otherwise. A typical reason for failure is an improper Swath ID.

**Description**
The dimension mapping list is returned as a string with each mapping separated by commas. The two dimensions in each mapping are separated by a slash (/). Output parameters set to NULL will not be returned.

**Example**
In this example, we retrieve information about the dimension mappings in the ExampleSwath structure:

```c
nmaps = HE5_SWinqmaps(swathID, dimmap, offset, increment);
```

The variable, dimmap, will contain the string: "GeoTrack/DataTrack,GeoXtrack/DataXtrack" with nmaps = 2, offset[2]={0,1} and increment[2]={2,2}.

**FORTRAN**
integer*4 function
he5_swinqmaps(swathid,dimmap,offset,increment)
integer swathid
classer*(*) dimmap
integer*4 offset(*)
integer*4 increment(*)

The equivalent FORTRAN code for the example above is:

```fortran
nmaps = he5_swinqmaps(swathid, dimmap, offset, increment)
```
# Retrieve Swath Structures Defined in HDF-EOS File

**HE5_SWinqswath**

long HE5_SWinqswath(const char * `filename`, char *`swathlist`, long *`strbufsize`)  

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>filename</code></td>
<td>IN: The HDF-EOS file name</td>
</tr>
<tr>
<td><code>swathlist</code></td>
<td>OUT: Swath list (entries separated by commas)</td>
</tr>
<tr>
<td><code>strbufsize</code></td>
<td>OUT: String length of swath list</td>
</tr>
</tbody>
</table>

**Purpose**

Retrieves number and names of swaths defined in HDF-EOS file.

**Return value**

Number of swaths found if successful or FAIL (-1) otherwise.

**Description**

The swath list is returned as a string with each swath name separated by commas. If `swathlist` is set to NULL, then the routine will return just the string buffer size, `strbufsize`. If `strbufsize` is also set to NULL, the routine returns just the number of swaths. Note that `strbufsize` does not count the null string terminator.

**Example**

In this example, we retrieve information about the swaths defined in an HDF-EOS file, Swath.he5. We assume that there are two swaths stored, `SwathOne` and `Swath_2`:

```c
nswath = HE5_SWinqswath("Swath.he5", NULL, &strbufsize);
```

The parameter, `nswath`, will have the value 2 and `strbufsize` will have value 16.

```c
nswath = HE5_SWinqswath("Swath.he5", swathlist, &strbufsize);
```

The variable, `swathlist`, will be set to:

"SwathOne,Swath_2".

**FORTRAN**

integer*4 function he5_swinqswath(filename,swathlist,strbufsize)  

character(*) filename  

character(*) swathlist  

integer*4 strbufsize  

The equivalent **FORTRAN** code for the example above is:

```fortran
nswath = he5_swinqswath('Swath.he5', swathlist, strbufsize)
```
Return Information about a Local Swath Attribute

HE5_SWlocattrinfo

herr_t HE5_SWlocattrinfo(hid_t swathID, const char *fieldname, const char *attrname, H5T_class_t *ntype, hsize_t *count)

- **swathID**: IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **fieldname**: IN: Field name
- **attrname**: OUT: Attribute name
- **ntype**: OUT: Data type class ID of attribute
- **count**: OUT: Number of attribute elements

**Purpose**
Returns information about a Data Field’s local attribute(s)

**Return value**
Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

**Description**
This routine returns number type and number of elements (count) of a data field’s local attribute.

**Example**
In this example, we return information about the *ScalarFloat* attribute.

```c
status = HE5_SWlocattrinfo(swathID, "DataField", attrname, &ntype, &count);
```

The `nt` variable will have the value 1 and `count` will have the value 1.

**FORTRAN**
integer function he5_swlatrinfo(swathid, fieldname, attrname, ntype, count)
   integer swathid
   character(*) attrname
   integer ntype
   integer *4 count

The equivalent **FORTRAN** code for the first example above is:

```fortran
status = he5_swlatrinfo(swathid, "DataField", attrname, ntype, count)
```
Retrieve Offset and Increment of Specific Dimension Mapping

HE5_SWmapinfo

herr_t HE5_SWmapinfo(hid_t swathID, char *geodim, char *datadim, long *offset, long *increment)

swathID IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
geodim IN: Geolocation dimension name
datadim IN: Data dimension name
offset OUT: Mapping offset
increment OUT: Mapping increment

Purpose Retrieve offset and increment of specific monotonic geolocation mapping.
Return value Returns SUCCEED (0) if successful or FAIL (-1) otherwise. A typical reason for failure is the specified mapping does not exist.
Description This routine retrieves offset and increment of the specified geolocation mapping.
Example In this example, we retrieve information about the mapping between the GeoTrack and DataTrack dimensions:

status = HE5_SWmapinfo(swathID, "GeoTrack", "DataTrack", &offset, &increment);

The variable offset will be 0 and increment 2.

FORTRAN integer function he5_swmapinfo(swathid, geodim, datadim, offset, increment)

integer swathid
character(*) geodim
character(*) datadim
integer*4 offset
integer*4 increment

The equivalent FORTRAN code for the example above is:

status = he5_swmapinfo(swathid, "GeoTrack", "DataTrack", offset, increment)
**Mount External Data File**

**HE5_SWmountexternal**

hid_t HE5_SWmountexternal(hid_t swathID, int fldgroup, const char *extfilename)

- **swathID**
  - IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **fldgroup**
  - IN: Field group flag
- **extfilename**
  - IN: External file name

**Purpose**
Mount external data file

**Return value**
Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

**Description**
This function allows the user to store required data needed by multiple data files into a separate file so it is not repeated thoughtout the data files.

**Example**
In this example, we mount a file that contains calibration information needed by the data fields in another file

```c
strcpy(extfilename,"/home/user/data/calibration.hdf5");
fileID = HE5_SWmountexternal(swathID, HE5_HDFE_DATAGROUP, extfilename);
```

**FORTRAN**
Not available with this release.
HE5_SWnentries

long HE5_SWnentries(hid_t swathID, int entrycode, long *strbufsize)

swathID      IN:  Swath ID returned by HE5_SWcreate or HE5_SWattach
entrycode    IN:  Entrycode
strbufsize   OUT:  String buffer size

Purpose  Returns number of entries and descriptive string buffer size for a specified entity.

Return value  Number of entries if successful or FAIL (-1) otherwise. A typical reason for failure is an improper swath id or entry code.

Description  This routine can be called before an inquiry routines in order to determine the sizes of the output arrays and descriptive strings. The string length does not include the NULL terminator.

The entry codes are:

- HE5_HDFE_NENTDIM   (0) - Dimensions
- HE5_HDFE_NENTMAP   (1) - Dimension Mappings
- HE5_HDFE_NENTIMAP  (2) - Indexed Dimension Mappings
- HE5_HDFE_NENTGFLD  (3) - Geolocation Fields
- HE5_HDFE_NENTDFLD  (4) - Data Fields

Example  In this example, we determine the number of dimension mapping entries and the size of the map list string.

nmaps = HE5_SWnentries(swathID, HE5_HDFE_NENTMAP, &bufsize);

The return value, nmaps, will be equal to 2 and bufsize = 39

FORTRAN  integer*4 function he5_swnentries(swathid, entrycode, bufsize)

integer swathid
integer entrycode
integer*4 bufsize

The equivalent FORTRAN code for the example above is:

parameter (HE5_HDFE_NENTMAP=1)

nmaps = he5_swnentries(swathid, HE5_HDFE_NENTMAP, bufsize)
Open HDF-EOS File

**HE5_SWopen**

hid_t HE5_SWopen(const char *filename, uintn access)

- **filename** IN: Complete path and filename for the file to be opened
- **access** IN: H5F_ACC_RDONLY, H5F_ACC_RDWR or H5F_ACC_TRUNC

**Purpose**
Opens or creates HDF-EOS file in order to create, read, or write a Swath.

**Return value**
Returns the swath file id handle (fid) if successful or FAIL (-1) otherwise.

**Description**
This routine creates a new file or opens an existing one, depending on the access parameter.

**Access codes:**
- H5F_ACC_RDONLY  Open for read only. If file does not exist, error
- H5F_ACC_RDWR   Open for read/write. If file does not exist, create it
- H5F_ACC_TRUNC    If file exist, delete it, then open a new file for read/write

**Example**
In this example, we create a new swath file named, Swath.he5. It returns the file handle, fid.

```c
fid = HE5_SWopen("Swath.he5", H5F_ACC_TRUNC);
```

**FORTRAN**

```
integer function he5_swopen(filename, access)
character(*) filename
integer (* ) access
```

The access codes should be defined as parameters:

- parameter (HE5_HDFE_RDWR = 0)
- parameter (HE5_HDFE_RDONLY = 1)
- parameter (HE5_HDFE_TRUNC = 2)

The equivalent FORTRAN code for the example above is:

```fortran
fid = he5_swopen("Swath.he5", HE5_HDFE_TRUNC)
```

**Note to users of the SDP Toolkit:** Please refer to the *Release 5B SDP Toolkit User Guide for the ECS Project (333-CD-510-001)*, Section 6.2.1.2, for information on how to obtain a file name (referred to as a “physical file handle”) from within a PGE. See also Section 9 of this document for code examples.
Return Information about a Defined Time Period

HE5_SWperiodinfo

herr_t HE5_SWperiodinfo(hid_t swathID, hid_t periodID, char *fieldname, H5T_class_t *ntype, int *rank, hsize_t dims[], size_t *size)

*swathID* IN: Swath ID returned by HE5_SWcreate or HE5_SWattach

*periodID* IN: Period ID returned by HE5_SWdeftimeperiod

*fieldname* IN: Field to subset

*ntype* OUT: Number type of field

*rank* OUT: Rank of field

*dims* OUT: Dimensions of subset period

*size* OUT: Size in bytes of subset period

Purpose Retrieves information about the subsetted period.

Return value Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

Description This routine returns information about a subsetted time period for a particular field. It is useful when allocating space for a data buffer for the subset. Because of differences in number type and geolocation mapping, a given time period will give different values for the dimensions and size for various fields.

Example In this example, we retrieve information about the time period defined in HE5_SWdeftimeperiod for the *Spectra* field. We use this to allocate space for data in the subsetted time period.

```c
/* Get size in bytes of time period for "Spectra" field*/
status = HE5_SWperiodinfo(SWid, periodID, "Spectra", &ntype, &rank, dims, &size);

/* Allocate space */
datbuf = (double *)calloc(size, sizeof(double));
```
FORTRAN

integer function he5_swperinfo(swathid, periodid, fieldname, ntype, rank, dims, size)

integer swathid
integer periodid
character*(*) fieldname
integer ntype
integer rank
integer*4 dims(*)
integer*4 size

The equivalent FORTRAN code for the example above is:

status=he5_swperinfo(swid,periodid,"Spectra",ntype,rank,dim,size)
**Read Swath Attribute**

**HE5_SWreadattr**

```c
herr_t HE5_SWreadattr(hid_t swathID, const char *attrname, void *datbuf)
```

- **swathID** IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **attrname** IN: Attribute name
- **datbuf** OUT: Buffer allocated to hold attribute values

**Purpose**
Reads attribute from a swath.

**Return value**
Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper swath id or number type or incorrect attribute name.

**Description**
The attribute is passed by reference rather than value in order that a single routine suffice for all numerical types.

**Example**
In this example, we read a floating point attribute with the name "ScalarFloat":

```c
status = HE5_SWreadattr(swathID, "ScalarFloat", &data);
```

**FORTRAN**

```fortran
integer function he5_swrdattr(swathid, attrname, datbuf)

integer swathid
<valid type> datbuf(*)
```

The equivalent **FORTRAN** code for the example above is:

```fortran
status = he5_swrdattr(swathid, "ScalarFloat", datbuf)
```
Read External Data Set

HE5_SWreadexternal

herr_t HE5_SWreadexternal(hid_t swathID, int fldgroup, const char *fieldname, void *buffer)

- swathID: IN - Swath ID returned by HE5_SWcreate or HE5_SWattach
- fldgroup: IN - Field group flag
- fieldname: IN - Name of field to read
- buffer: OUT - Output data buffer

Purpose
Read external data set

Return value
Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

Description
This function allows the user to get the data required from the external data file.

Example
In this example, the field “Cal data” is read from the external file:

```c
strcpy(fieldname, "Cal data");
status = HE5_SWreadexternal(swathID, HE5_HDFE_DATAGROUP, fieldname, buffer);
```

FORTRAN
Not available with this release.
Read Data from a Swath Field

**HE5_SWreadfield**

```c
herr_t HE5_SWreadfield(hid_t swathID, char *fieldname, const hssize_t start[],
const hsize_t stride[], const hsize_t edge[], void *buffer)
```

- **swathID**: IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **fieldname**: IN: Name of field to read
- **start**: IN: Array specifying the starting location within each dimension
- **stride**: IN: Array specifying the number of values to skip along each dimension
- **edge**: IN: Array specifying the number of values to read along each dimension
- **buffer**: OUT: Buffer to store the data read from the field

**Purpose**
Reads data from a swath field.

**Return value**
Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are improper swath id or unknown fieldname.

**Description**
The values within `start`, `stride`, and `edge` arrays refer to the swath field (input) dimensions. The output data in `buffer` is written to contiguously. The default values for `start` and `stride` are 0 and 1 respectively and are used if these parameters are set to NULL. The default values for `edge` are \((dim - start) / stride\) where `dim` refers is the size of the dimension.

**Example**
In this example, we read data from the 10th track (0-based) of the `Longitude` field.

```c
float    track[1000];

hssize_t start[2] = {9,1};
hsizet   edge[2] = {1,1000};

status = HE5_SWreadfield(swathID, "Longitude", start, NULL,
edge, track);
```
FORTRAN integer function he5_swrdfld(swathid, fieldname, start, stride, edge, buffer)

integer swathid
character(*) fieldname
integer*4 start(*)
integer*4 stride(*)
integer*4 edge(*)
<valid type> buffer(*)

The start, stride, and edge arrays must be defined explicitly, with the start array being 0-based.

The equivalent FORTRAN code for the example above is:

real*4 track(1000)
integer*4 start(2), stride(2), edge(2)
start(1) = 0
start(2) = 10
stride(1) = 1
stride(2) = 1
edge(1) = 1000
edge(2) = 1
status=he5_swrdfld(swathid,"Longitude",start,stride,
edge,track)
Read Group Swath Attribute

HE5_SWreadgrpattr

herr_t HE5_SWreadgrpattr(hid_t swathID, const char *attrname, void *datbuf)

- `swathID`: IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- `attrname`: IN: Attribute name
- `datbuf`: OUT: Buffer allocated to hold attribute values

Purpose
Reads attribute from a swath.

Return value
Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper swath ID or number type or incorrect attribute name.

Description
The attribute is passed by reference rather than value in order that a single routine suffice for all numerical types.

Example
In this example, we read a floating point attribute with the name "ScalarFloat":

```c
status = HE5_SWreadgrpattr(swathID, "ScalarFloat", &data);
```

FORTRAN

```fortran
integer function he5_swrdgattr(swathid, attrname, datbuf)
integer swathid
character(*) attrname
<valid type> datbuf(*)

The equivalent FORTRAN code for the example above is:

```fortran
status = he5_swrdgattr(swathid, "ScalarFloat", datbuf)
```
Read Local Swath Attribute

**HE5_SWreadlocattr**

```c
herr_t HE5_SWreadlocattr(hid_t swathID, const char *fieldname, const char *attrname, void *datbuf)
```

- **swathID**
  - IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **fieldname**
  - IN: Field name
- **attrname**
  - IN: Attribute name
- **datbuf**
  - OUT: Buffer allocated to hold attribute values

**Purpose**
Reads attribute from a swath.

**Return value**
Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper swath id or number type or incorrect attribute name.

**Description**
The attribute is passed by reference rather than value in order that a single routine suffice for all numerical types.

**Example**
In this example, we read a single precision (32 bit) floating point attribute with the name "ScalarFloat":

```c
status = HE5_SWreadlocattr(swathID, "DataField", "ScalarFloat", &data);
```

**FORTRAN**

```fortran
integer function he5_swrdlattr(swathid, fieldname, attrname, datbuf)
  integer swathid
  character(*) fieldname
  character(*) attrname
  <valid type> datbuf(*)
```

The equivalent **FORTRAN** code for the example above is:

```fortran
status = he5_swrdlattr(swathid, "DataField", "ScalarFloat", datbuf)
```
Define a Longitude-Latitude Box Region for a Swath

HE5_SWregionindex

hid_t HE5_SWregionindex(hid_t swathID, double cornerlon[], double cornerlat[], int mode, char *geodim, hsize_t idxrange[])

swathID IN: Swath ID returned by HE5_SWcreate or HE5_SWattach

cornerlon IN: Longitude in decimal degrees of box corners

cornerlat IN: Latitude in decimal degrees of box corners

mode IN: Cross Track inclusion mode

geodim OUT: Geolocation track dimension

idxrange OUT: The indices of the region in the geolocation track dimension.

Purpose Defines a longitude-latitude box region for a swath.

Return value Returns the swath region ID if successful or FAIL (-1) otherwise.

Description The difference between this routine and HE5_SWdefboxregion is the geolocation track dimension name and the range of that dimension are returned in addition to a regionID. Other than that difference they are the same function and this function is used just like HE5_SWdefboxregion. This routine defines a longitude-latitude box region for a swath. It returns a swath region ID which is used by the HE5_SWextractregion routine to read all the entries of a data field within the region. A cross track is within a region if 1) its midpoint is within the longitude-latitude "box" (HE5_HDFE_MIDPOINT), or 2) either of its endpoints is within the longitude-latitude "box" (HE5_HDFE_ENDPOINT), or 3) any point of the cross track is within the longitude-latitude "box" (HE5_HDFE_ANYPOINT), depending on the inclusion mode designated by the user. All elements within an included cross track are considered to be within the region even though a particular element of the cross track might be outside the region. The swath structure must have both Longitude and Latitude (or Colatitude) fields defined.

Example In this example, we define a region bounded by the 3 degrees longitude, 5 degrees latitude and 7 degrees longitude, 12 degrees latitude. We will consider a cross track to be within the region if its midpoint is within the region.

cornerlon[0] = 3.;
cornerlat[0] = 5.;
cornerlon[1] = 7.;
cornerlat[1] = 12.;
regionID = HE5_SWregionindex(swathID, cornerlon, cornerlat,
HE5_HDFE_MIDPOINT, geodim, idxrange);

FORTRAN integer function he5_swregidx(swathid, cornerlon, cornerlat, mode,
geodim, idxrange)
integer swathid
real*8 cornerlon(*)
real*8 cornerlat(*)
character(*) geodim
integer*4 idxrange(*)

The equivalent FORTRAN code for the example above is:

parameter (HE5_HDFE_MIDPOINT=0)
cornerlon(1) = 3.
cornerlat(1) = 5.
cornerlon(2) = 7.
cornerlat(2) = 12.
regionid = he5_swregidx(swathid, cornerlon, cornerlat,
HE5_HDFE_MIDPOINT, geodim, idxrange)
Return Information about a Defined Region

HE5_SWregioninfo

herr_t HE5_SWregioninfo(hid_t swathID, hid_t regionID, char *fieldname,
                        H5T_class_t *ntype, int *rank, hsize_t dims[], size_t *size)

swathID    IN:  Swath ID returned by HE5_SWcreate or HE5_SWattach
regionID   IN:  Region ID returned by HE5_SWdefboxregion
fieldname IN:  Field to subset
ntype      OUT: Number type of field
rank       OUT: Rank of field
dims       OUT: Dimensions of subset region
size       OUT: Size in bytes of subset region

Purpose  Retrieves information about the subsetted region.

Return value  Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

Description  This routine returns information about a subsetted region for a particular field. It is useful when allocating space for a data buffer for the region. Because of differences in number type and geolocation mapping, a given region will give different values for the dimensions and size for various fields.

Example  In this example, we retrieve information about the region defined in HE5_SWdefboxregion for the Spectra field. We use this to allocate space for data in the subsetted region.

/* Get size in bytes of region for "Spectra" field*/

status = HE5_SWregioninfo(SWid, regionID, "Spectra", &ntype,
                           &rank, dims, &size);

/* Allocate space */

datbuf = (double *)calloc(size, sizeof(double));
FORTRAN  integer function he5_swreginfo(swathid, regionid, fieldname, ntype, rank, dims, size)

integer         swathid
integer         regionid
character(*)    fieldname
integer         ntype
integer         rank
integer*4       dims(*)
integer*4       size

The equivalent FORTRAN code for the example above is:

status =
he5_swreginfo(swid,regionid,"Spectra",ntype,rank,dims,size)
Create an Alias for Swath Data Field

**HE5_SWsetalias**

```c
herr_t HE5_SWsetalias(hid_t swathID, char *fieldname, const char *aliaslist)
```

- **swathID**  
  IN: Swath ID returned by HE5_SWcreate or HE5_SWattach

- **fieldname**  
  IN: Field name

- **aliaslist**  
  IN: List of alias(es) to associate with the Data Field

**Purpose**
Create an alias for Swath data field

**Return value**
Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

**Description**
Creates aliases that can be used to refer to a Swath data field in addition to the name of the field.

**Example**
In this example, we create and alias for the data field `Temperature`.

```c
strcpy(aliaslist, "temps 0 to 30");
status = HE5_SWsetalias(swathID, "Temperature", aliaslist);
```

**FORTRAN**

```fortran
integer function he5_swsetalias (swathid, fieldname, aliaslist)
integer swathid
character(*) fieldname
character(*) aliaslist
```

The equivalent `FORTRAN` code for the first example above is:

```fortran
aliaslist = "temps 0 to 30"
status = he5_swsetalias(swathid, "Temperature", aliaslist)
```
**Set External Data File(s)**

**HE5_SWsetextdata**

```c
herr_t HE5_SWsetextdata(hid_t swathID, const char *filelist, off_t offset[], hsize_t size[])
```

- **swathID** IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **filelist** IN: List of external file names
- **offset[]** IN: Array of offsets (in byte) from the beginning of file to the location in file where the data starts
- **size[]** IN: Array of sizes (in bytes) reserved in the file for the data

**Purpose** Sets the external data file(s) associated with the data set.

**Return value** Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper swath ID.

**Example** In this example, we set the ExtData field:

```c
status = HE5_SWsetextdata(swathID, "ext-1.dat,ext-2.dat,ext-3.dat", offset, size);
```

**FORTRAN**

```fortran
integer function he5_swsetxdat(swathid,fllist,offset, size)
  integer swathid
  integer status
  integer*4 offset(*)
  integer*4 size(*)
  character*(*) fllist
```

The equivalent **FORTRAN** code for the example above is:

```fortran
status = he5_swsetxdat(swathid,fllist,offset,size)
```
Set Fill Value for a Specified Field

**HE5_SWsetfillvalue**

herr_t HE5_SWsetfillvalue(hid_t swathID, char *fieldname, hid_t ntype, void *fillvalue)

- **swathID** IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **fieldname** IN: Field name
- **ntype** IN: Number type of fill value (should match the number type of a specified field)
- **fillvalue** IN: Pointer to the fill value to be used

**Purpose** Sets fill value for the specified field.

**Return value** Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper swath id or number type.

**Description** The fill value is placed in all elements of the field which have not been explicitly defined. The field must have 2 or more dimensions.

**Example** In this example, we set a fill value for the *Temperature* field:

```c
tempfill = -999.0;
status = HE5_SWsetfillvalue(swathID, "Temperature", ntype, &tempfill);
```

**FORTRAN**

integer function he5_swsetfill(swathid, fieldname, ntype, fillvalue)

- **swathid**
- **fieldname**
- **ntype**<valid type>
- **fillvalue(*)**

The equivalent **FORTRAN** code for the example above is:

```fortran
fillvalue = -999.0
status = he5_swsetfill(swathid, "Temperature", ntype, fillvalue)
```
Dismount External Data File

HE5_SWunmount

herr_t HE5_SWunmount(hid_t swathID, int fldgroup, hid_t fileID)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>swathID</td>
<td>Swath ID returned by HE5_SWcreate or HE5_SWattach</td>
</tr>
<tr>
<td>fldgroup</td>
<td>Field group flag</td>
</tr>
<tr>
<td>fileID</td>
<td>ID of file returned by HE5_SWmountexternal</td>
</tr>
</tbody>
</table>

Purpose
Dismount external data file

Return value
Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

Description
This function dismounts from the external file once the user has completed using the data in the file.

Example
In this example, we dismount from the file used in the previous function

```
status = HE5_SWunmount(swathID, HE5_HDFE_DATAGROUP, fileID);
```

FORTRAN
Not available with this release.
Update map index for a specified region

HE5_SWupdateidxmap

long HE5_SWupdateidxmap(int swathID, hid_t regionID, long indexin[], long indexout[], long indices[])

- **swathID** IN: Swath ID returned by HE5_SWcreate or Swattach.
- **regionID** IN: Region ID returned by HE5_SWdefboxregion.
- **indexin** IN: The array containing the indices of the data dimension to which each geolocation element corresponds.
- **indexout** OUT: The array containing the indices of the data dimension to which each geolocation corresponds in the subsetted region. The indexout set to NULL, will not be returned.
- **indices** OUT: The array containing the indices for start and stop of region.

**Purpose**: Retrieve indexed array of specified geolocation mapping for a specified region.

**Return value**: Returns size of updated indexed array if successful or FAIL (-1) otherwise. A typical reason for failure is the specified mapping does not exist.

**Description**: This routine retrieves the size of the indexed array and the array of indexed elements of the specified geolocation mapping for the specified region.

**Example**: In this example, we retrieve information about the indexed mapping between the “IdxGeo” and “IdxData” dimensions, defined by HE5_SWdefboxregion:

```c
/* Get size of index_region array */
idxsz = HE5_SWupdateidxmap(swathID, regionID, index, NULL, indices);

/* Allocate memory for index_region */
index_region = (long)malloc(sizeof(long) * idxsz);

/* Get the array index_region */
idxsz = HE5_SWupdateidxmap(swathID, regionID, index, index_region, indices);
```
FORTRAN

integer*4 function he5_swupimap(swathid, regionid, indexin, indexout, indices)

integer swathid
integer regionid
integer*4 indexin(*)
integer*4 indexout(*)
integer*4 indices(2)

The equivalent FORTRAN code for the example above is:

status = he5_swupdateidxmap(swathid, regionid, index, index_region, indices)
Write/Update Swath Attribute

HE5_SWwriteattr

herr_t HE5_SWwriteattr(hid_t swathID, const char *attrname, hid_t ntype, hsize_t count[], void *datbuf)

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>swathID</td>
<td>Swath ID returned by HE5_SWcreate or HE5_SWattach</td>
</tr>
<tr>
<td>attrname</td>
<td>Attribute name</td>
</tr>
<tr>
<td>ntype</td>
<td>Number type of attribute</td>
</tr>
<tr>
<td>count</td>
<td>Number of values to store in attribute</td>
</tr>
<tr>
<td>datbuf</td>
<td>Attribute values</td>
</tr>
</tbody>
</table>

Purpose Writes/Updates attribute in a swath.

Return value Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper swath id or number type.

Description If the attribute does not exist, it is created. If it does exist, then the value(s) is (are) updated. The attribute is passed by reference rather than value in order that a single routine suffice for all numerical types. Because of this a literal numerical expression should not be used in the call.

Example In this example, we write a floating point number with the name "ScalarFloat" and the value 3.14:

\[
\text{attr_val} = 3.14;
\]

\[
\text{status} = \text{HE5_SWwriteattr} (\text{swathid}, "\text{ScalarFloat}", \text{H5T_NATIVE_FLOAT}, 1, &\text{attr_val});
\]

We can update this value by simply calling the routine again with the new value:

\[
\text{attr_val} = 3.14159;
\]

\[
\text{status} = \text{HE5_SWwriteattr} (\text{swathid}, "\text{ScalarFloat}", \text{H5T_NATIVE_FLOAT}, 1, &\text{attr_val});
\]
FORTRAN integer function he5_swrrattr(swathid, attrname, ntype, count, datbuf)
integer swathid
character(*) attrname
integer*4 count(*)
<valid type> datbuf(*)
The equivalent FORTRAN code for the first example above is:

parameter (HE5_HDFE_NATIVE_FLOAT = 1)
datbuf = 3.14
count = 1
status = he5_swrrattr(swathid, "ScalarFloat",
HE5_HDFE_NATIVE_FLOAT, count, datbuf)
**Write Field Metadata for an Existing Swath Data Field**

**HE5_SWwritedatameta**

```c
herr_t HE5_SWwritedatameta(hid_t swathID, const char *fieldname, char *dimlist, int mvalue)
```

- **swathID** IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **fieldname** IN: Name of field
- **dimlist** IN: The list of data dimensions defining the field
- **mvalue** IN: The number type of the data stored in the field

**Purpose**

Writes field metadata for an existing swath data field.

**Return value**

Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reason for failure is unknown dimension in the dimension list.

**Description**

This routine writes field metadata for an existing data field. This is useful when the data field was defined without using the swath API. Note that any entries in the dimension list must be defined through the `HE5_SWdefdim` routine before this routine is called.

**Example**

In this example we write the metadata for the “Band_1” data field used in the swath.

```c
status = HE5_SWwritedatameta(swathID, "Band_1", "GeoTrack, GeoXtrack", H5T_NATIVE_FLOAT);
```

**FORTRAN**

```fortran
integer function he5_swwrdmeta(swathid,fieldname,dimlist,mvalue)
  integer swathid
  character(*) fieldname
  character(*) dimlist
  integer mvalue
end function he5_swwrdmeta
```

The equivalent **FORTRAN** code for the example above is:

```fortran
parameter (HE5_HDFE_NATIVE_FLOAT = 1)
status = he5_swwrdmeta(swathID, "Band_1", "GeoXtrack", HE5_HDFE_NATIVE_FLOAT)
```

The dimensions are entered in **FORTRAN** order with the first dimension being incremented first.
Write Data to a Swath Field

**HE5_SWwritefield**

herr_t HE5_SWwritefield(hid_t swathID, char *fieldname, const hssize_t start[], const hsize_t stride[], const hsize_t edge[], void *data)

- **swathID** IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **fieldname** IN: Name of field to write
- **start** IN: Array specifying the starting location within each dimension (0-based)
- **stride** IN: Array specifying the number of values to skip along each dimension
- **edge** IN: Array specifying the number of values to write along each dimension
- **data** IN: Values to be written to the field

**Purpose**
Writes data to a swath field.

**Return value**
Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper swath id or unknown fieldname.

**Description**
The values within `start`, `stride`, and `edge` arrays refer to the swath field (output) dimensions. The input data in the `data` buffer is read from contiguously. The default values for `start` and `stride` are 0 and 1 respectively and are used if these parameters are set to `NULL`. The default values for `edge` are `(dim - start) / stride` where `dim` refers is the size of the dimension. It is the users responsibility to make sure the data buffer contains sufficient entries to write to the field. Note that the data buffer for a compressed field must be the size of the entire field as incremental writes are not supported by the underlying HDF routines.

**Example**
In this example, we write data to the **Longitude** field.

```c
float longitude [2000][1000];
/* Define elements of longitude array */
status = HE5_SWwritefield(swathID, "Longitude", NULL, NULL, NULL, longitude);
```
We now update Track 10 (0-based) in this field:

```c
float newtrack[1000];
hssize_t start[2]={10,0}; hsize_t edge[2]={1,1000};
/* Define elements of newtrack array */
status = HE5_SWwritefield(swathID, "Longitude", start, NULL,
edge, newtrack);
```

FORTRAN integer function

```fortran
he5_swwrfld(swathid,fieldname,start,stride,edge,data)
integer swathid
character*(*) fieldname
integer*4 start(*)
integer*4 stride(*)
integer*4 edge(*)
<valid type> data(*)
```

The `start`, `stride`, and `edge` arrays must be defined explicitly, with the `start` array being 0-based.

The equivalent FORTRAN code for the example above is:

```fortran
real*4    longitude(1000,2000)
integer*4 start(2), stride(2), edge(2)
start(1) = 0
start(2) = 10
stride(1) = 1
stride(2) = 1
edge(1) = 1000
edge(2) = 2000
status = he5_swwrfld(swathid, "Longitude", start, stride, 
edge, longitude)
```

We now update Track 10 (0-based) in this field:

```fortran
real*4    newtrack(1000)
integer*4 start(2), stride(2), edge(2)
```
start(1) = 10
start(2) = 0
stride(1) = 1
stride(2) = 1
edge(1) = 1000
edge(2) = 1
status = he5_swwrfl3d(swathid, "Longitude", start, stride, edge, newtrack)
Write Field Metadata to an Existing Swath Geolocation Field

**HE5_SWwritegeometa**

```c
herr_t HE5_SWwritegeometa(hid_t swathID, const char *fieldname, char *dimlist, int mvalue)
```

- **swathID** IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **fieldname** IN: Name of field
- **dimlist** IN: The list of geolocation dimensions defining the field
- **mvalue** IN: The number type of the data stored in the field

**Purpose** Writes field metadata for an existing swath geolocation field.

**Return value** Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reason for failure is unknown dimension in the dimension list.

**Description** This routine writes field metadata for an existing geolocation field. This is useful when the data field was defined without using the swath API. Note that any entries in the dimension list must be defined through the `HE5_SWdefdim` routine before this routine is called.

**Example** In this example we write the metadata for the `Latitude` geolocation field used in the swath.

```c
status = HE5_SWwritegeometa(swathID, "Latitude", "GeoTrack,GeoXtrack", H5T_NATIVE_FLOAT);
```

**FORTRAN** integer function

```fortran
he5_swwritegeometa(swathid,fieldname,dimlist,mvalue)
```

- integer `swathid`
- character(*) `fieldname`
- character(*) `dimlist`
- integer `mvalue`

The equivalent FORTRAN code for the example above is:

```fortran
parameter (HE5_HDFE_NATIVE_FLOAT = 1)
```
status = he5_swwrmeta(swathID, "Latitude",
                   "GeoXtrack,GeoTrack",HE5_HDFE_NATIVE_FLOAT)

The dimensions are entered in *FORTRAN* order with the first dimension being incremented first.
Write/Update Group Swath Attribute

**HE5_SWwritegrpattr**

```c
herr_t HE5_SWwritegrpattr(hid_t swathID, const char *attrname, hid_t ntype, hsize_t count[], void *datbuf)
```

- **swathID**  
  IN: Swath ID returned by HE5_SWcreate or HE5_SWattach

- **attrname**  
  IN: Attribute name

- **ntype**  
  IN: Data type of attribute

- **count**  
  IN: Number of values to store in attribute

- **datbuf**  
  IN: Attribute values

**Purpose**  
Writes/Updates group attribute in a swath.

**Return value**  
Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper swath id or number type.

**Description**  
If the attribute does not exist, it is created. If it does exist, then the value(s) is (are) updated. The attribute is passed by reference rather than value in order that a single routine suffice for all numerical types. Because of this a literal numerical expression should not be used in the call. The attribute is linked to the “Data Fields” group in the swath file.

**Example**  
In this example, we write a single precision (32 bit) floating point number with the name "ScalarFloat" and the value 3.14:

```c
count[0] = 1;
attr_val = 3.14;
status = HE5_SWwritegrpattr(swathid, "ScalarFloat",
H5T_NATIVE_FLOAT, count, &attr_val);
```

We can update this value by simply calling the routine again with the new value:

```c
attr_val = 3.14159;
status = HE5_SWwritegrpattr(swathid, "ScalarFloat",
H5T_NATIVE_FLOAT, count, &attr_val);
```
FORTRAN

integer function he5_swwrgattr(swathid, attrname, ntype, count, datbuf)

integer swathid
character*(*) attrname
integer ntype
integer*4 count(*)
<valid type> datbuf(*)

The equivalent FORTRAN code for the first example above is:

parameter (HE5_HDFE_NATIVE_FLOAT=1)
datbuf = 3.14
count = 1
status = he5_swwrgattr(swathid, "ScalarFloat",
HE5_HDFE_NATIVE_FLOAT,count,datbuf)
Write/Update Local Swath Attribute

HE5_SWwritelocattr

herr_t HE5_SWwritelocattr(hid_t swathID, const char *fieldname, char *attrname, hid_t ntype, hsize_t count[], void *datbuf)

swathID IN: Swath ID returned by HE5_SWcreate or HE5_SWattach

fieldname IN: Field name

attrname IN: Attribute name

ntype IN: Data type of attribute

count IN: Number of values to store in attribute

datbuf IN: Attribute values

Purpose Writes/Updates group attribute in a swath.

Return value Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper swath id or number type.

Description If the attribute does not exist, it is created. If it does exist, then the value(s) is (are) updated. The attribute is passed by reference rather than value in order that a single routine suffice for all numerical types. Because of this a literal numerical expression should not be used in the call. The attribute is linked to a particular “Data Field” in the swath file.

Example In this example, we write a floating point number with the name "ScalarFloat" and the value 3.14:

count[0] = 1;

attr_val = 3.14;

status = HE5_SWwritelocattr(swathid, "DataField", "ScalarFloat", H5T_NATIVE_FLOAT, count, &attr_val);

We can update this value by simply calling the routine again with the new value:

attr_val = 3.14159;

status = HE5_SWwritelocattr(swathid, "DataField", "ScalarFloat", H5T_NATIVE_FLOAT, count, &attr_val);
FORTRAN

integer function he5_swwrlattr(swathid, fieldname, attrname, ntype, count, datbuf)

integer swathid
character(*) fieldname
character(*) attrname
integer ntype
integer*4 count(*)
<valid type> datbuf(*)

The equivalent FORTRAN code for the first example above is:

parameter (HE5_HDFE_NATIVE_FLOAT=1)
datbuf = 3.14
count = 1
status = he5_swwrlattr(swathid, "DataField", "ScalarFloat", HE5_HDFE_NATIVE_FLOAT, count, datbuf)
Define Profile Data Structure

**HE5_PRdefine**
herr_t HE5_PRdefine(hid_t swathID, const char *profilename, char *dimlist, char *maxdimlist, hid_t datatype_id)

- **swathID** IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **profilename** IN: Profile name
- **dimlist** IN: List of profile dimensions (separated by comma)
- **maxdimlist** IN: List of profile maximum dimensions (separated by comma)
- **dtype** IN: Base data type ID

**Purpose**
Sets up a specified profile structure in a swath.

**Return value**
Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper swath ID or data type ID.

**Description**
The profile is linked to the “Data Fields” group in the swath file.

**Example**
In this example, we define a profile with the name SimpleProfile and with the base ‘unsigned int’ data type. The profile is represented by a single dataset with 4 dimensions.

```c
status = HE5_PRdefine(swathid, "SimpleProfile", dimlist, maxdimlist, H5T_NATIVE_UINT);
```

**FORTRAN**
integer function he5_prdefine(swathid, profilename, rank, dim, datatype_id)

```fortran
integer swathid
character(*) profilename
character(*) dimlist
character(*) maxdimlist(*)
integer datatype_id
```

The equivalent FORTRAN code for the example above is:

```fortran
parameter (HE5_HDFE_NATIVE_INT = 0)
status = he5_prdefine(swathid, "SimpleProfile", dimlist, maxdimlist, HE5_HDFE_NATIVE_INT)
```
Return Information about a Profile in a Swath

HE5_PRinfo

herr_t HE5_PRinfo(hid_t swathID, const char *profname, int *rank, hsize_t dims[], hsize_t maxdims[], H5T_class_t *classID, char *dimlist, char *maxdimlist)

- swathID: IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- profname: IN: Profile name
- rank: OUT: Rank of profile dataset
- dims: OUT: Array of dimension sizes
- maxdims: OUT: Array of maximum dimension sizes
- classID: OUT: Base-data type class ID
- dimlist: OUT: Comma separated list of dimension names
- maxdimlist: OUT: Comma separated list of maximum dimension names

Purpose: Retrieve information about specified profile dataset in a Swath

Return value: Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

Description: This routine returns rank, array of dimension and maximum dimension sizes, base data type class ID, comma separated list of dimension and maximum dimension names of profile dataset.

Example:
In this example, we retrieve information about profile “Profile-2000”:

```c
status = HE5_PRinfo(swathID,"Profile-2000", rank, dims, maxdims, classID, dimlist, maxdimlist);
```

FORTRAN

integer function he5_prinfo( swathid, profname, rank, dims, maxdims, classid, dimlist, maxdimlist)
integer  swathid
character(*) profname
integer  rank
integer*4  dims(*)
integer*4  maxdims(*)
integer  classID
character(*) dimlist
character(*) maxdimlist
The equivalent *FORTRAN* code for the first example above is:

```fortran
profname = "Profile-2000"
status = he5_prinfo(swathid, profname, rank, dims, maxdims, classid, dimlist, maxdimlist)
```
Retrieve Information about Profiles in a Swath

**HE5_PRinquire**

long HE5_PRinquire(hid_t swathID, char *profnames, int *rank, H5T_class_t *classID)

*swathID*  IN: Swath ID returned by HE5_SWcreate or HE5_SWattach

*profnames*  OUT: Buffer for returned comma separated list of profile names

*rank*  OUT: Array of ranks of profile datasets

*classID*  OUT: Array of base-data type class IDs of profiles

**Purpose** Retrieve information about profile datasets in a specified Swath

**Return value** Returns number of profiles if successful or FAIL (-1) otherwise.

**Description** A comma separated list of profile datasets is returned. The *rank* and (base data type) *classID* arrays will have an entry for each profile.

**Example** In this example, we retrieve information about profiles:

```
nprof = HE5_PRinquire(swathID, profnames, rank, classID);
```

**FORTRAN**

integer*4 function he5_prinquire (swathid, profnames, rank, classID)
integer swathid
character(*) profnames
integer rank(*)
integer classID(*)

The equivalent FORTRAN code for the first example above is:

```
nprof = he5_prinquire(swathid, profnames, rank, classID)
```
Read Data from Profile Structure

**HE5_PRread**

```c
herr_t HE5_PRread(hid_t swathID, const char *profilename, const hssize_t start[], const hsize_t stride[], const hsize_t edge[], void *datbuf)
```

- **swathID**: IN: Swath ID returned by HE5_SWcreate or HE5_SWattach
- **profilename**: IN: Profile structure name
- **start**: IN: Array specifying starting location within each dimension
- **stride**: IN: Array specifying the number of values to skip along each dimension
- **edge**: IN: Array specifying the number of values to write along each dimension
- **datbuf**: OUT: Buffer allocated to hold profile values

**Purpose**
Reads profile data set from a swath.

**Return value**
Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper swath id or incorrect profile name.

**Description**
After reading the data a call to **HE5_PRreclaimspace()** should be made to release allocated memory.

**Example**
In this example, we read an ‘unsigned int’ type profile with the name "SimpleProfile":

```c
typedef struct {
    size_t len; /* Length of VL data (for base type)*/
    void *p;  /* Pointer to VL data */
} hvl_t;

hvl_t     buffer[4];
start[0] = 0;
stride[0] = 1;
```
edge[0] = 4;

status = HE5_PRread(swathID, "SimpleProfile", start, stride, edge, buffer);

for (i=0; i<4; i++) {
    printf("The length of %d-th element is %d \n", i, (unsigned)buffer[i].len);
    for (j=0; j<2; j++)
        printf("%d \n", ((unsigned int*)buffer[i].p)[j]);
}

status = HE5_PRreclaimspace(swathID, "SimpleProfile", buffer);

FORTRAN integer function
he5_prread(swathid, profname, start, stride, count, len, buffer)

integer swathid, status
character *(*) profname
integer*4 start(2), stride(2), count(2), len(4)

The equivalent FORTRAN code for the example above is:

start(1) = 0
stride(1) = 1
count(1) = 4

status = he5_prread(swathid, "SimpleProfile", start, stride, count, len, buffer)
Reclaim Memory used by “Read” Buffer

HE5_PRreclaimspace

herr_t HE5_PRreclaimspace(hid_t swathID, const char *profilename, void *buffer)

- **swathID** (IN): Swath ID returned by HE5_SWcreate or HE5_SWattach
- **profilename** (IN): Profile name
- **buffer** (IN): Data buffer used to read profile dataset

**Purpose**: Release memory used by the buffer in the call HE5_PRread().

**Return value**: Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

**Description**: Reclaims memory space allocated to the data buffer in the call HE5_PRread().

**Example**: In this example, we reclaim memory allocated for the “read” buffer “buffer”

```c
status = HE5_PRreclaimspace(swathID, "Profile-2000", buffer);
```

**FORTRAN**: Not needed.
Write Data to the Profile Swath Structure

**HE5_PRwrite**

```c
herr_t HE5_PRwrite(int swathID, const char *profilename, const hssize_t start[],
                   const hsize_t stride[], const hsize_t edge[], size_t size, void *
datbuf)
```

- **swathID** (IN): Swath ID returned by HE5_SWcreate or HE5_SWattach
- **profilename** (IN): Profile structure name
- **start** (IN): Array specifying the starting location within each dimension (0-based)
- **stride** (IN): Array specifying the number of values to skip along each dimension
- **edge** (IN): Array specifying the number of values to write along each dimension
- **size** (IN): Size of data buffer (in bytes) for memory allocation routine
- **datbuf** (IN): Profile data values

**Purpose**: Writes profile data set in a swath.

**Return value**: Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper swath id or profile name.

**Description**: The specified profile is linked to a "Data Fields" group in the swath file.

**Example**: In this example, we write data to "SimpleProfile":

```c
data_t datasize = 0;
hvl_t buf[4];
for (i = 0; i < 4; i++){
    buf[i].p = malloc(25*(i+1)*sizeof(unsigned int));
    buf[i].len = 25*(i+1);
    datasize += buf[i].len *sizeof(unsigned int);
    for (j = 0; j < 25*(i+1); j++)
        ((unsigned int )buf[i].p)[j] = (i+1)*10+j;
}
```
status = HE5_PRwrite(swathid, "SimpleProfile", start, stride, edge, datasize, buf);

**FORTRAN**

```fortran
integer function he5_prwrite(swathid, profname, start, stride ,count, datasize, len, buffer)
integer swathid,status
integer*4 start(3),stride(3),count(3),len(4),datasize
integer buffer(*), i, j, counter

The equivalent FORTRAN code for the example above is:

datasize = 0
counter = 0
do i=1,4
   len(i) = i*25
   datasize = datasize + len(i)
   do j = 1,(25*i)
      counter = counter + 1
      buffer(counter) = (i)*1000+j-1
   enddo
enddo

start(1) = 0
stride(1) = 1
count(1) = 4
status = he5_prwrite(swathid, "SimpleProfile", start, stride, count, datasize, len, buffer)
```
2.1.3 Grid Interface Functions

This section contains an alphabetical listing of all the functions in the Grid interface. The functions are alphabetized based on their C-language names.
Attach to an Existing Grid Structure

HE5_GDattach

hid_t HE5_GDattach(hid_t fid, char *gridname)

- **fid**: IN: Grid file ID returned by HE5_GDopen
- **gridname**: IN: Name of grid to be attached

**Purpose**: Attaches to an existing grid within the file.

**Return value**: Returns the grid handle(gridID) if successful or FAIL(-1) otherwise. Typical reasons for failure are improper grid file id or grid name.

**Description**: This routine attaches to the grid using the gridname parameter as the identifier.

**Example**: In this example, we attach to the previously created grid, "ExampleGrid", within the HDF-EOS file, Grid.he5, referred to by the handle, fid:

```c
gridID = HE5_GDattach(fid, "ExampleGrid");
```

The grid can then be referenced by subsequent routines using the handle, gridID.

**FORTRAN**: integer function he5_gdattach(fid, gridname)

```fortran
integer fid
character(*) gridname
```

The equivalent FORTRAN code for the example above is:

```fortran
gridid = he5_gdattach(fid, "ExampleGrid")
```
Return Information about a Grid Attribute

HE5_GDattrinfo

herr_t HE5_GDattrinfo(hid_t gridID, const char *attrname, H5T_class_t *ntype, hsize_t *count)

gridID  IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
attrname IN: Attribute name
ntype  OUT: Number type of attribute
count OUT: Number of total bytes in attribute

Purpose Returns information about a grid attribute
Return value Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

Description This routine returns number type and number of elements (count) of a grid attribute.

Example In this example, we return information about the ScalarFloat attribute.

```c
status = HE5_GDattrinfo(gridID, "ScalarFloat", &ntype, &count);
```

The ntype variable will have the value 5 and count will have the value 4.

FORTRAN integer function he5_gdattrinfo(gridid, attrname, ntype, count,)
integer gridid
character(*) attrname
integer ntype
integer*4 count

The equivalent FORTRAN code for the first example above is:

```fortran
status = he5_gdattrinfo(gridid, "ScalarFloat", ntype, count)
```
Write Block SOM Offset

**HE5_GDblkSOMoffset**

herr_t HE5_GDblkSOMoffset(hid_t gridID, long offset[], hsize_t count, char *code)

gridID  
**IN:** Grid ID returned by HE5_GDcreate or HE5_GDattach

offset  
**IN:** Offset values for SOM Projection data

count  
**IN:** Number of offset values to write

code  
**IN:** Write/Read code

**Purpose**
Write block SOM offset values.

**Return value**
Returns SUCCEED(0) if successful or FAIL(-1) otherwise.

**Description**
The routine supports structures that contain data which have been written in the Solar Oblique Mercator (SOM) projection. The structure can contain one to many blocks, each with corner points defined by latitude and longitude. The routine can only be used by grids that use the SOM projection. The routine writes the offset values, in pixels, from a standard SOM projection. There is an offset value for every block in the grid except for the first block. The count parameter is used as a check for the number of offset values. This routine will also return the offset values, but the user must know how large the offset array needs to be before calling the function, in that case the code value would be “r” and the count parameter has to be provided also.

**Example**
In this example, we first show how the SOM projection is defined using HE5_GDdefproj, then we show how the SOM projection is modified using HE5_GDblkSOMoffset:

The first parameter is the Grid ID, the second is the projection code for the SOM projection, the third is the zone code, not needed for the SOM projection, the fourth is the sphere code, not needed for the SOM projection and the last parameter is the projection parameter array. Each projection supported by the Grid interface has a unique set of variables that are used by the GCTP library and they are passed to the GCTP library through this array. As you can see below, the twelfth parameter is set to a non-zero value, it is set to the size of the number of blocks in the data field. This is required if the function HE5_GDblkSOMoffset is going to be called. The GCTP library doesn’t use this parameter for the SOM projection so that is used by the HDF-EOS library only. The
HE5_GDblkSOMoffset function checks that parameter first before anything else is done.

projparm[0] = 6378137.0;
projparm[1] = 0.006694348;
projparm[3] = HE5_EHconvAng(98.161, HE5_HDFE_DEG_DMS);
projparm[4] = HE5_EHconvAng(87.11516945924, HE5_HDFE_DEG_DMS);
projparm[8] = 0.068585416 * 1440;
projparm[9] = 0.0;
status = HE5_GDdefproj(GDid_som, HE5_GCTP_SOM, NULL, NULL, projparm);

Now that the projection has been defined, HE5_GDblkSOMoffset can be called:

offset[5] = {5, 10, 12, 8, 2};
count = 5;
code = “w”;
status = HE5_GDblkSOMoffset(gridID, offset, count, code);

This set the offset for the second block to 5 pixels, the third block to 10 pixels, fourth block to 12 pixels, fifth to 8 pixels and the sixth block to 2 pixels.

NOTE: This routine is currently implemented in “C” only. If the need arises, a FORTRAN function will be added.

Interblock subsetting is not currently supported by the ECS Science Data Server, at this time. That is, a response to a request to return data contained within a specified latitude/longitude box, will be in an integral number of blocks.

Close an HDF-EOS File

HE5_GDclose

herr_t HE5_GDclose(hid_t fid)

fid IN: Grid file ID returned by HE5_GDopen

Purpose Closes file.

Return value Returns SUCCEED(0) if successful or FAIL(-1) otherwise.

Description This routine closes the HDF-EOS grid file.

Example

status = HE5_GDclose(fid);

FORTRAN integer function he5_gdclose(fid)

integer fid

The equivalent FORTRAN code for the example above is:

status = he5_gdclose(fid)
Retreive Compression Information for Field

**HE5_GDcompinfo**

```
herr_t HE5_GDcompinfo(hid_t gridID, const char *fieldname, char *compcode, int compparm[])
```

- **gridID** IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
- **fieldname** IN: Fieldname
- **compcode** OUT: HDF compression code
- **compparm** OUT: Compression parameters

**Purpose** Retrieves compression information about a field.

**Return value** Returns SUCCEED(0) if successful or FAIL(-1) otherwise.

**Description** This routine returns the compression code and compression parameters for a given field.

**Example** To retreive the compression information about the *Opacity* field defined in the *HE5_GDdefcomp* section:

```
status = HE5_GDcompinfo(gridID, "Opacity", compcode, compparm);
```

The *compcode* parameter will be set to 4 and *compparm*[0] to 5.

**FORTRAN**

```
integer function he5_gdcompinfo(gridid,fieldname compcode, compparm)
integer gridid
character(*) filename
character(*) compcode
integer compparm(*)
```

The equivalent *FORTRAN* code for the example above is:

```
status = he5_gdcompinfo(gridid, 'Opacity', compcode, compparm)
```

The *compcode* parameter will be set to 4 and *compparm*(1) to 5.
Create a New Grid Structure

**HE5_GDcreate**

hid_t HE5_GDcreate(hid_t fid, const char *gridname, long xdimsize, long ydimsize, double upleftpt[], double lowrightpt[])  

- **fid** IN: Grid file ID returned by HE5_GDopen  
- **gridname** IN: Name of grid to be created  
- **xdimsize** IN: Number of columns in grid  
- **ydimsize** IN: Number of rows in grid  
- **upleftpt** IN: Location, of upper left corner of the upper left pixel  
- **lowrightpt** IN: Location, of lower right corner of the lower right pixel  

**Purpose** 
Creates a grid within the file.

**Return value** 
Returns the grid handle(gridID) or FAIL(-1) otherwise.

**Description** 
The grid is created as a group within the HDF-EOS file with the name gridname. This routine establishes the resolution of the grid, ie, the number of rows and columns, and it's location within the complete global projection through the upleftpt and lowrightpt arrays. These arrays should be in meters for all GCTP projections other than the Geographic Projection, which should be in packed degree format. q.v. below.

**Example** 
In this example, we create a UTM grid bounded by 54 E to 60 E longitude and 20 N to 30 N latitude. We divide it into 120 bins along the x-axis and 200 bins along the y-axis.

uplft[0]=210584.50041;  
uplft[1]=3322395.95445;  
lowrgt[0]=813931.10959;  
lowrgt[1]=2214162.53278;  
xdim=120;  
ydim=200;  

gridID = HE5_GDcreate(fid, "UTMGrid", xdim, ydim, uplft, lowrgt);  

2-150 175-TP-511-003
The grid structure is then referenced by subsequent routines using the handle, gridID.

The xdim and ydim values are referenced in the field definition routines by the reserved dimensions: XDim and YDim.

For the Polar Stereographic, Goode Homolosine and Lambert Azimuthal projections, we have established default values in the case of an entire hemisphere for the first projection, the entire globe for the second and the entire polar or equitorial projection for the third. Thus, if we have a Polar Stereographic projection of the Northern Hemisphere then the uplft and lowrgt arrays can be replaced by NULL in the function call.

In the case of the Geographic projection (linear scale in both longitude and latitude), the upleftpt and lowrightpt arrays contain the longitude and latitude of these points in packed degree format (DDDDMMSSSS.SS).

Note:

**upleftpt** - Array that contains the X-Y coordinates of the upper left corner of the upper left pixel of the grid. First and second elements of the array contain the X and Y coordinates respectively. The upper left X coordinate value should be the lowest X value of the grid. The upper left Y coordinate value should be the highest Y value of the grid.

**lowrightpt** - Array that contains the X-Y coordinates of the lower right corner of the lower right pixel of the grid. First and second elements of the array contain the X and Y coordinates respectively. The lower right X coordinate value should be the highest X value of the grid. The lower right Y coordinate value should be the lowest Y value of the grid.

If the projection id geographic (i.e., projcode=0) then the X-Y coordinates should be specified in degrees/minutes/seconds (DDDDMMSSSS.SS) format. The first element of the array holds the longitude and the second element holds the latitude. Latitudes are from -90 to +90 and longitudes are from -180 to +180 (west is negative).

For all other projection types the X-Y coordinates should be in **meters** in double precision. These coordinates have to be computed using the **GCTP** software with the same projection parameters that have been specified in the **projparm** array. For UTM projections use the same zone code and its sign (positive or negative) while computing both upper left and lower right corner X-Y coordinates irrespective of the hemisphere.

To convert lat/long to x-y coordinates, it is also possible to use SDP Toolkit routines: PGS_GCT_Init() or PGS_GCT_Proj(). More information is contained in the **SDP Toolkit Users Guide for the ECS Project**.
FORTRAN

integer function he5_gdcreate(fid, gridname, xdimsize, ydimsize, upleftpt, lowrightpt)

integer fid
character*(*) gridname
integer*4 xdimsize
integer*4 ydimsize
real*8 upleftpt(2)
real*8 lowrightpt(2)

The equivalent *FORTRAN* code for the example above is:

gridid = he5_gdcreate(fid, "UTMGrid", xdim, ydim, uplft, lowrgt)

The default values for the Polar Stereographic and Goode Homolosine can be designated by setting all elements in the *uplft* and *lowrgt* arrays to 0.
Define Region of interest by Latitude/Longitude

**HE5_GDdefboxregion**

hid_t HE5_GDdefboxregion(hid_t gridID, double cornerlon[], double cornerlat[])

- **gridID** IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
- **cornerlon** IN: Longitude in decimal degrees of box corners
- **cornerlat** IN: Latitude in decimal degrees of box corners

**Purpose** Defines a longitude-latitude box region for a grid.

**Return value** Returns the grid region ID if successful or FAIL (-1) otherwise.

**Description** This routine defines a longitude-latitude box region for a grid. It returns a grid region ID which is used by the `HE5_GDextractregion` routine to read all the entries of a data field within the region.

**Example** In this example, we define the region to be the first quadrant of the Northern hemisphere.

```c
cornerlon[0] = 0.;    cornerlat[0] = 90.;
cornerlon[1] = 90.;   cornerlat[1] = 0.;
regionID = HE5_GDdefboxregion(GDid, cornerlon, cornerlat);
```

**FORTRAN**

```fortran
integer function he5_gddefboxreg(gridid, cornerlon, cornerlat)
integer  gridid
real*8   cornerlon(2)
real*8   cornerlat(2)

The equivalent FORTRAN code for the example above is:

```c
cornerlon(1) = 0. 
cornerlat(1) = 90. 
cornerlon(2) = 90. 
cornerlat(2) = 0. 
regionid = he5_gddefboxreg(gridid, cornerlon, cornerlat)
```
Set Grid Field Compression

**HE5_GDdefcomp**

```c
herr_t HE5_GDdefcomp(hid_t gridID, int compcode, int compparm[])
```

- **gridID**  
  IN: Grid ID returned by HE5_GDcreate or HE5_GDattach

- **compcode**  
  IN: HDF compression code

- **compparm**  
  IN: Compression parameters (if applicable)

**Note:** Only deflate compression is supported in this release.

**Purpose**  
Sets the field compression for all subsequent field definitions.

**Return value**  
Returns SUCCEED(0) if successful or FAIL(-1) otherwise.

**Description**  
This routine sets the HDF field compression for subsequent grid field definitions. The compression does not apply to one-dimensional fields. The compression schemes currently supported are: run length encoding (HE5_COMP_DEFLATE=4) and no compression (HE5_COMP_NONE = 0, the default). Deflate compression requires a single integer compression parameter in the range of one to nine with higher values corresponding to greater compression. Compressed fields are written using the standard `HE5_GDwritefield` routine, however, the entire field must be written in a single call. If this is not possible, the user should consider tiling. See `HE5_GDdeftile` for further information. Any portion of a compressed field can then be accessed with the `HE5_GDreadfield` routine. Compression takes precedence over merging so that multi-dimensional fields that are compressed are not merged. The user should refer to the HDF Reference Manual for a fuller explanation of the compression schemes and parameters.

**Example**  
Suppose we wish to compress the fields Pressure, Opacity and Spectra using deflate compression, and use no compression for the Temperature field.

```c
status = HE5_GDdefcomp(gridID, HE5_HDFE_COMP_DEFLATE, NULL);
status = HE5_GDdeffield(gridID, "Pressure", "YDim,XDim", NULL, H5T_NATIVE_FLOAT, HE5_HDFE_NOMERGE);
status = HE5_GDdeffield(gridID, "Opacity", "YDim,XDim", NULL, H5T_NATIVE_FLOAT, HE5_HDFE_NOMERGE);
status = HE5_GDdeffield(gridID, "Spectra","Bands,YDim,XDim", NULL, H5T_NATIVE_FLOAT, HE5_HDFE_NOMERGE);
```

2-154 175-TP-511-003
status = HE5_GDdefcomp(gridID, HE5_HDFE_COMP_NONE, NULL);

status = HE5_GDdeffield(gridID, "Temperature", "YDim,XDim", NULL, H5T_NATIVE_FLOAT, HE5_HDFE_NOMERGE);

Note that the HE5_HDFE_NOMERGE parameter will be ignored in the field definitions.

FORTRAN

integer function he5_gddefcomp(gridid, compcode, compparm)

integer gridid
integer compcode
integer compparm(*)

The equivalent FORTRAN code for the example above is:

parameter (HE5_HDFE_NATIVE_FLOAT=1)
parameter (HE5_HDFE_COMP_NONE=0)
parameter (HE5_HDFE_COMP_DEFLATE=4)
parameter (HE5_HDFE_NOMERGE = 0)

status = he5_gddefcomp(gridid, HE5_HDFE_COMP_DEFLATE, compparm)
status = he5_gddeffld(gridid, "Pressure", "YDim,XDim", " ", HE5_HDFE_NATIVE_FLOAT,HE5_HDFE_NOMERGE)
status = he5_gddeffld(gridid, "Opacity", "YDim,XDim", " ", HE5_HDFE_NATIVE_FLOAT,HE5_HDFE_NOMERGE)
status = he5_gddeffld(gridid, "Spectra", "Bands,YDim,XDim", " ", HE5_HDFE_NATIVE_FLOAT,HE5_HDFE_NOMERGE)
status = he5_gddefcomp(gridid, HE5_HDFE_COMP_NONE, compparm)
status = he5_gddeffld(gridid, "Temperature", "YDim,XDim", " ", HE5_HDFE_NATIVE_FLOAT,HE5_HDFE_NOMERGE)
Define Compression with Data Tiling

HE5_GDdefcomtile

herr_t HE5_GDdefcomtile(hid_t gridID, int compcode, int *compparm, int tilerank, const hsize *tiledim)

gridID IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
compcode IN: Compression method flag
compparm IN: Array of compression parameters
tilerank IN: Rank of a field to compress
tiledim IN: Array of sizes of tile

Purpose Compress the data field
Return value Returns SUCCEED (0) if successful or FAIL (-1) otherwise.
Description This function allows the user to set compression for a data field with automatic tiling

Example In this example, we set (DEFLATE) compression for a field that is defined right after this call

```c
compcode = 4;
compparm[0] = 6;
status = HE5_GDdefcomtile(gridID, compcode, compparm, tilerank, tiledim);
```

FORTRAN integer function he5_gddefcomtile(gridid, compcode, compparm, tilerank, tiledim)

```fortran
integer gridid
ingteger compcode
integer compparm(*)
ingteger tilerank
integer*4 tiledim
```

The equivalent FORTRAN code for the example above is

```fortran
status = he5_gddefcomtle(gridid, compcode, compparm, tilerank, tiledim)
```
Define a New Dimension within a Grid

HE5_GDdefdim

herr_t HE5_GDdefdim(hid_t gridID, char *dimname, hsize_t dim)

<table>
<thead>
<tr>
<th>gridID</th>
<th>IN: Grid ID returned by HE5_GDcreate or HE5_GDattach</th>
</tr>
</thead>
<tbody>
<tr>
<td>dimname</td>
<td>IN: Name of dimension to be defined</td>
</tr>
<tr>
<td>dim</td>
<td>IN: The size of the dimension</td>
</tr>
</tbody>
</table>

Note: Merging is not supported in this release of the library. There are three illegal characters for field names: “/”, “;”, “,”

Purpose Defines a new dimension within the grid.

Return value Returns SUCCEED(0) if successful or FAIL(-1) otherwise. Typical reason for failure is an improper grid id.

Description This routine defines dimensions that are used by the field definition routines (described subsequently) to establish the size of the field.

Example In this example, we define a dimension, Band, with size 15.

```c
status = HE5_GDdefdim(gridID, "Band", 15);
```

To specify an unlimited dimension which can be used to define an appendable array, the dimension value should be set to zero or equivalently, H5S_UNLIMITED:

```c
status = HE5_GDdefdim(gridID, "Unlim", H5S_UNLIMITED);
```

FORTRAN integer function he5_gddefdim(gridid, fieldname, dim)

<table>
<thead>
<tr>
<th>gridid</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>character*()</td>
<td>fieldname</td>
</tr>
<tr>
<td>integer*4</td>
<td>dim</td>
</tr>
</tbody>
</table>

The equivalent FORTRAN code for the example above is:

```fortran
parameter (H5S_UNLIMITED=-1)

dim = 15

status = he5_gddefdim(gridid, "Band", dim)
status = he5_gddefdim(gridid, "Unlim", H5S_UNLIMITED)
```
Define a New Data Field within a Grid

**HE5_GDdeffield**

```c
herr_t HE5_GDdeffield(hid_t gridID, const char *fieldname, char *dimlist, char *maxdimlist, hid_t ntype, int merge)
```

- **gridID** - IN: Grid ID returned by HE5_GDcreate or HE5_GDattach.
- **fieldname** - IN: Name of field to be defined.
- **dimlist** - IN: The list of data dimensions defining the field.
- **maxdimlist** - IN: The maximum dimensions list defining the field.
- **ntype** - IN: The number type of the data stored in the field.
- **merge** - IN: Merge code (HE5_HDFE-NOMERGE (0) - no merge, HE5_HDFE_AUTOMERGE (1) -merge).

**Note:** Merging is not supported in this release of the library. There are three illegal characters for field names: “/”, “;”, “,”.

**Purpose**
Defines a new data field within the grid.

**Return value**
Returns SUCCEED(0) if successful or FAIL(-1) otherwise. Typical reason for failure is an unknown dimension in the dimension list.

**Description**
This routine defines data fields to be stored in the grid. The dimensions are entered as a string consisting of geolocation dimensions separated by commas. They are entered in C order, that is, the last dimension is incremented first.

**Example**
In this example, we define a grid field, Temperature with dimensions XDim and YDim (as established by the HE5_GDcreate routine) containing 4-byte floating point numbers and a field, Spectra, with dimensions XDim, YDim, and Bands:

```c
status = HE5_GDdeffield(gridID, "Temperature", "YDim,XDim", NULL, H5T_NATIVE_FLOAT, 0);
status = HE5_GDdeffield(gridID, "Spectra", "Bands,YDim,XDim", NULL, H5T_NATIVE_FLOAT, 0);
```

**FORTRAN**

```fortran
integer function he5_gddeffld(gridid, fieldname, dimlist, maxdimlist, ntype, merge)
integer                      gridid
```

character(*)  *fieldname*
character(*)  *dimlist*
character(*)  *maxdimlist*

integer     *ntype, merge*

The equivalent FORTRAN code for the example above is:

```fortran
parameter (HE5_HDFE_NATIVE_FLOAT=1)
parameter (HE5_HDFE_NOMERGE=0)
status = he5_gddefld(gridid, "Temperature", "XDim,YDim", "",
                    HE5_HDFE_NATIVE_FLOAT,HE5_HDFE_NOMERGE)
status = he5_gddefld(gridid, "Spectra", "XDim,YDim,Bands", "",
                    HE5_HDFE_NATIVE_FLOAT,HE5_HDFE_NOMERGE)
```

The dimensions are entered in FORTRAN order with the first dimension incremented first.
Define the Origin of the Grid Data

**HE5_GDdeforigin**

```c
herr_t HE5_GDdeforigin(hid_t gridID, int origincode)
```

- **gridID**  IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
- **origincode**  IN: Location of the origin of the grid data

**Purpose**
Defines the origin of the grid data

**Return Value**
Returns SUCCEED(0) if successful or FAIL(-1) otherwise

**Description**
The routine is used to define the origin of the grid data. This allows the user to select any corner of the grid as the origin.

**Origin Codes:**
- HE5_HDFE_GD_UL (Default) (0) Upper Left corner of grid
- HE5_HDFE_GD_UR (1) Upper Right corner of grid
- HE5_HDFE_GD_LL (2) Lower Left corner of grid
- HE5_HDFE_GD_LR (3) Lower Right corner of grid

**Example**
In this example we define the origin of the grid to be the Lower Right corner:

```c
status = HE5_GDdeforigin(gridID, HE5_HDFE_GD_LR);
```

**FORTRAN**

```fortran
integer function he5_gddeforg(gridid, origincode)
integer gridid
integer origincode
```

The equivalent FORTRAN code for the above example is:

```fortran
parameter (HE5_HDFE_GD_LR=3)
status = he5_gddeforg(gridid, HE5_HDFE_GD_LR)
```
**Define a Pixel Registration within a Grid**

**HE5_GDdefpixreg**

```c
herr_t HE5_GDdefpixreg(hid_t gridID, int pixregcode)
```

- **gridID**  
  IN: Grid ID returned by HE5_GDcreate or HE5_GDattach

- **pixregcode**  
  IN: Pixel registration code

**Purpose**  
Defines pixel registration within grid cell

**Return Value**  
Returns SUCCEED(0) if successful or FAIL(-1) otherwise.

**Description**  
This routine is used to define whether the pixel center or pixel corner (as defined by the HE5_GDdeforigin routine) is used when requesting the location (longitude and latitude) of a given pixel.

**Registration Codes:**
- HE5_HDFE_CENTER (0)  (Default) Center of pixel cell
- HE5_HDFE_CORNER (1)  Corner of a pixel cell

**Example**  
In this example, we define the pixel registration to be the corner of the pixel cell:

```c
status = HE5_GDdefpixreg(gridID, HE5_HDFE_CORNER);
```

**FORTRAN**

```fortran
integer function he5_gddefpixreg(gridid, pixregcode)

integer       gridid
integer       pixregcode

The equivalent FORTRAN code for the example above is:

```c
class parameter (HE5_HDFE_CORNER=1)
```

```c
status = he5_gddefpixreg(gridid, HE5_HDFE_CORNER)
```
Define Grid Projection

HE5_GDdefproj

herr_t HE5_GDdefproj(hid_t gridID, int projcode, int zonecode, int spherecode, double projparm[])

gridID  IN:  Grid ID returned by HE5_GDcreate or HE5_GDattach
projcode IN:  GCTP projection code
zonecode IN:  GCTP zone code used by UTM projection
spherecode IN:  GCTP spheroid code
projparm IN:  GCTP projection parameter array
Purpose  Defines projection of grid
Return Value  Returns SUCCEED(0) if successful or FAIL(-1) otherwise
Description  Defines the GCTP projection and projection parameters of the grid.
Example  In this example, we define a Universal Transverse Mercator (UTM) grid bounded by 54 E - 60 E longitude and 20 N - 30 N latitude – UTM zonecode 40, using default spheroid (Clarke 1866), spherecode = 0

spherecode = 0;
zonecode = 40;
status = HE5_GDdefproj(gridID, HE5_GCTP_UTM, zonecode, spherecode, NULL);

In this next example we define a Polar Stereographic projection of the Northern Hemisphere (True scale at 90 N, 0 Longitude below pole) using the International 1967 spheriod.

spherecode = 3;
for (i = 0; i < 13; i++) projparm[i] = 0;
/* Set Long below pole & true scale in DDDMMSSTMSSSSS form */
projparm[5] = 90000000.00;
status = HE5_GDdefproj(gridID, HE5_GCTP_PS, NULL, spherecode, projparm);

Finally we define a Geographic projection. In this case neither the zone code, sphere code or the projection parameters are used.
status = HE5_GDdefproj(gridID, HE5_GCTP_GEO, NULL, NULL, NULL)

FORTRAN

integer function he5_gddefproj(gridid, projcode, zonecode, spherecode, projparm)

integer gridid
integer projcode
integer zonecode
integer spherecode
real*8 projparm(*)

The equivalent FORTRAN code for the examples above is:

parameter (HE5_GCTP_UTM=1)
spherecode = 0
zonecode = 40
status = he5_gddefproj(gridid, HE5_GCTP_UTM, zonecode, spherecode, dummy)

parameter (HE5_GCTP_PS=6)
spherecode = 6
do i=1,13
    projparm(i) = 0
enddo
projparm(6) = 90000000.00
status = he5_gddefproj(gridid, HE5_GCTP_PS, dummy, spherecode, projparm)

parameter (GCTP_GEO=0)
status = he5_gddefproj(gridid, HE5_GCTP_GEO, dummy, dummy, dummy)

Note: projcode, zonecode, spherecode and projection parameter information are listed in Section 1.6, GCTP Usage.
Define Tiling Parameters

**HE5_GDdeftile**

```c
herr_t HE5_GDdeftile(hid_t gridID, int tilecode, int tilerank, const hsize_t *tiledims[])
```

- **gridID**  
  IN: Grid ID returned by HE5_GDcreate or HE5_GDattach

- **tilecode**  
  IN: Tile code: HE5_HDF_TILE, HE5_HDF_NOTILE (default)

- **tilerank**  
  IN: The number of tile dimensions

- **tiledims**  
  IN: Tile dimensions

**Purpose**
Defines tiling dimensions for subsequent field definitions

**Return Value**
Returns SUCCEED(0) if successful or FAIL(-1) otherwise

**Description**
This routine defines the tiling dimensions for fields defined following this function call, analogous to the procedure for setting the field compression scheme using HE5_GDdefcomp. The number of tile dimensions and subsequent field dimensions must be the same and the tile dimensions must be integral divisors of the corresponding field dimensions. A tile dimension set to 0 will be equivalent to 1.

**Example**
We will define four fields in a grid, two two-dimensional fields of the same size with the same tiling, a three-dimensional field with a different tiling scheme, and a fourth with no tiling. We assume that XDim is 200 and YDim is 300.

```c
tiledims[0] = 100;
tiledims[1] = 200;
status = HE5_GDdeftile(gridID, HE5_HDFE_TILE, 2, tiledims);
status = HE5_GDdeffield(gridID, "Pressure", "YDim,XDim", NULL, H5T_NATIVE_INT, 0);
status = HE5_GDdeffield(gridID, "Temperature", "YDim,XDim", NULL, H5T_NATIVE_FLOAT, 0);
tiledims[0] = 1;
tiledims[1] = 150;
tiledims[2] = 100;
status = HE5_GDdeftile(gridID, HE5_HDFE_TILE, 3, tiledims);
```
status = HE5_GDdeffield(gridID, "Spectra", "Bands,YDim,XDim", NULL, H5T_NATIVE_FLOAT, HE5_HDFE_NOMERGE);
status = HE5_GDdeftile(gridID, HE5_HDFE_NOTILE, 0, NULL);
status = HE5_GDdeffield(gridID, "Communities", "YDim,XDim", NULL, H5T_NATIVE_INT, HE5_HDFE_AUTOMERGE);

FORTRAN

integer function he5_gddeftile(gridid, tilecode,tilerank,tiledims)
integer gridid
integer tilecode
integer tilerank
integer*4 tiledims(*)
The equivalent FORTRAN code for the example above is:
parameter (HE5_HDFE_NATIVE_INT=0)
parameter (HE5_HDFE_NATIVE_FLOAT=1)
parameter (HE5_HDFE_NOTILE=0)
parameter (HE5_HDFE_TILE=1)
parameter (HE5_HDFE_NOMERGE = 0)
tiledims(1) = 200
tiledims(2) = 100
tilerank = 2
status = he5_gddeftile(gridid, HE5_HDFE_TILE,tilerank, tiledims)
status = he5_gddeffld(gridid, 'Pressure', 'XDim,YDim', " ", HE5_HDFE_NATIVE_INT, HE5_HDFE_NOMERGE)
status = he5_gddeffld(gridid, 'Temperature', 'XDim,YDim', " ", HE5_HDFE_NATIVE_FLOAT, HE5_HDFE_NOMERGE)
tiledims[1] = 100
tiledims[2] = 150
tiledims[3] = 1
tilerank = 3
status = he5_gddeftle(gridid, HE5_HDFE_TILE, tilerank, tiledims)

status = he5_gddeffld(gridid, 'Spectra', 'XDim,YDim,Bands', " ", HE5_HDFE_NATIVE_FLOAT, HE5_HDFE_NOMERGE)

tilerank = 2

status = he5_gddeftle(gridid, HE5_HDFE_NOTILE, tilerank, tiledims);

status = he5_gddeffld(gridid, 'Communities', 'XDim,YDim', " ", HE5_HDFE_NATIVE_INT, HE5_HDFE_AUTOMERGE)
Define a Time Period of interest

**HE5_GDdeftimeperiod**

```c
herr_t HE5_GDdeftimeperiod(hid_t gridID, hid_t periodID, double starttime, double stoptime)
```

- **gridID** (IN): Grid ID returned by HE5_GDcreate or HE5_GDattach
- **periodID** (IN): Period (or region) id from previous subset call
- **starttime** (IN): Start time of period
- **stoptime** (IN): Stop time of period

**Purpose**: Defines a time period for a grid.

**Return value**: Returns the grid period ID if successful or FAIL (-1) otherwise.

**Description**: This routine defines a time period for a grid. It returns a grid period ID which is used by the `HE5_GDextractperiod` routine to read all the entries of a data field within the time period. The grid structure must have the `Time` field defined. This routine may be called after `HE5_GDdefboxregion` to provide both geographic and time subsetting. In this case the user provides the id from the previous subset call. (This same id is then returned by the function.) Furthermore it can be called before or after `HE5_GDdefvrtregion` to further refine a region. This routine may also be called “stand-alone” by setting the input id to HE5_HDFE_NOPREVSUB (-1).

**Example**: In this example, we define a time period with a start time of 35232487.2 and a stop time of 36609898.1.

```c
starttime = 35232487.2;
stoptime = 36609898.1;
periodID = HE5_GDdeftimeperiod(gridID, HE5_HDFE_NOPREVSUB, starttime, stoptime);
```

If we had previously performed a geographic subset with id, `regionID`, then we could further time subset this region with the call:

```c
periodID = HE5_GDdeftimeperiod(gridID, regionID, starttime, stoptime);
```

Note that `periodID` will have the same value as `regionID`. 
integer function he5_gddeftmeper(gridid, periodID, starttime, stoptime)

integer gridid
integer periodid
real*8 starttime
real*8 stoptime

The equivalent FORTRAN code for the examples above are:

parameter (HE5_HDFE_NOPREVSUB=-1)
starttime = 35232487.2
stoptime = 36609898.1
periodid = he5_gddeftmeper(gridid, HE5_HDFE_NOPREVSUB, starttime, stoptime)
periodid = he5_gddeftmeper(gridid, regionid, starttime, stoptime)
Define a Vertical Subset Region

**HE5_GDdefvrtregion**

hid_t HE5_GDdefvrtregion(hid_t gridID, hid_t regionID, char *vertObj, double range[])

- **gridID** IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
- **regionID** IN: Region (or period) id from previous subset call
- **vertObj** IN: Dimension or field to subset
- **range** IN: Minimum and maximum range for subset

**Purpose** Subsets on a **monotonic** field or contiguous elements of a dimension.

**Return value** Returns the grid region ID if successful or FAIL (-1) otherwise.

**Description** Whereas the *HE5_GDdefboxregion* routine subsets along the *XDim* and *YDim* dimensions, this routine allows the user to subset along any other dimension. The region is specified by a set of minimum and maximum values and can represent either a dimension index (case 1) or field value range (case 2). In the second case, the field must be one-dimensional and the values must be **monotonic** (strictly increasing or decreasing) in order that the resulting dimension index range be contiguous. (For the current version of this routine, the second option is restricted to fields with number type: INT, LONG, FLOAT, DOUBLE.) This routine may be called after *HE5_GDdefboxregion* to provide both geographic and “vertical” subsetting. In this case the user provides the id from the previous subset call. (This same id is then returned by the function.) This routine may also be called “stand-alone” by setting the input id to HE5_HDFE_NOPREVSUB (-1).

This routine may be called up to eight times with the same region ID. It this way a region can be subsetted along a number of dimensions.

The *HE5_GDregioninfo* and *HE5_GDextractregion* routines work as before, however the field to be subsetted, (the field specified in the call to *HE5_GDregioninfo* and *HE5_GDextractregion*) must contain the dimension used explicitly in the call to *HE5_GDdefvrtregion* (case 1) or the dimension of the one-dimensional field (case 2).

**Example** Suppose we have a field called *Pressure* of dimension *Height* (= 10) whose values increase from 100 to 1000. If we desire all the elements with values between 500 and 800, we make the call:
range[0] = 500.;
range[1] = 800.;
regionID = HE5_GDdefvrtregion(gridID, HE5_HDFE_NOPREVSUB, "Pressure", range);

The routine determines the elements in the Height dimension which correspond to the values of the Pressure field between 500 and 800.

If we wish to specify the subset as elements 2 through 5 (0 - based) of the Height dimension, the call would be:

range[0] = 2;
range[1] = 5;
regionID = HE5_GDdefvrtregion(gridID, HE5_HDFE_NOPREVSUB, "DIM:Height", range);

The “DIM:” prefix tells the routine that the range corresponds to elements of a dimension rather than values of a field.

If a previous subset region or period was defined with id, subsetID, that we wish to refine further with the vertical subsetting defined above we make the call:

regionID = HE5_GDdefvrtregion(gridID, subsetID, "Pressure", range);

The return value, regionID is set equal to subsetID. That is, the subset region is modified rather than a new one created.

In this example, any field to be subsetted must contain the Height dimension.

FORTRAN

integer function he5_gddefvrtreg(gridid, regionid, vertobj, range)
integer gridid
integer regionid
character(*) vertobj
real*8 range(2)

The equivalent FORTRAN code for the examples above is:

parameter (HE5_HDFE_NOPREVSUB=-1)
range(1) = 500.
range(2) = 800.
regionid = he5_gddefvrtreg(gridid, HE5_HDFE_NOPREVSUB, "Pressure", range)
range(1) = 3 ! Note 1-based element numbers
range(2) = 6
regionid = he5_gddefvrtreg(gridid, HE5_HDFE_NOPREVSUB, "DIM:Height", range)
regionid = he5_gddefvrtreg(gridid, subsetid, "Pressure", range)
HE5_GDdetach

herr_t HE5_GDdetach(hid_t gridID)

gridID    IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
Purpose    Detaches from grid interface.
Return value Returns SUCCEED(0) if successful or FAIL(-1) otherwise.
Description This routine should be run before exiting from the grid file for every grid
open by HE5_GDcreate or HE5_GDattach.
Example    In this example, we detach the grid structure, ExampleGrid:
             status = HE5_GDdetach(gridID);
FORTRAN    integer function he5_gddetach(gridid)
             integer     gridid
             The equivalent FORTRAN code for the example above is:
             status = he5_gddetach(gridid)
Retrieve Size of Specified Dimension

**HE5_GDdiminfo**

```c
hsize_t HE5_GDdiminfo(hid_t gridID, char *dimname)
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gridID</td>
<td>IN: Grid ID returned by HE5_GDcreate or HE5_GDattach</td>
</tr>
<tr>
<td>dimname</td>
<td>IN: Dimension name</td>
</tr>
</tbody>
</table>

**Purpose**
Retrieve size of specified dimension.

**Return value**
Size of dimension if successful or FAIL(-1) otherwise. A typical reason for failure is an improper grid id or dimension name.

**Description**
This routine retrieves the size of specified dimension.

**Example**
In this example, we retrieve information about the dimension, "Bands":

```c
dimsize = HE5_GDdiminfo(gridID, "Bands");
```

The return value, `dimsize`, will be equal to 15

**FORTRAN**

```fortran
integer*4 function he5_gddiminfo(gridid, dimname)
    integer    gridid
    character(*) dimname
    dimsize = he5_gddiminfo(gridid, "Bands")
```

The equivalent FORTRAN code for the example above is:

```fortran
dimsize = he5_gddiminfo(gridid, "Bands")
```
Duplicate a Region or Period

**HE5_GDdupregion**

hid_t HE5_GDdupregion(hid_t oldregionID)

- **oldregionID**
  - IN: Region or period ID returned by HE5_GDdefboxregion, HE5_GDdeftimeperiod, or HE5_GDdefvrtregion.

**Purpose**
Duplicates a region.

**Return value**
Returns new region or period ID if successful or FAIL (-1) otherwise.

**Description**
This routine copies the information stored in a current region or period to a new region or period and generates a new id. It is usefully when the user wishes to further subset a region (period) in multiple ways.

**Example**
In this example, we first subset a grid with **HE5_GDdefboxregion**, duplicate the region creating a new region ID, `regionID2`, and then perform two different vertical subsets of these (identical) geographic subset regions:

```c
regionID = HE5_GDdefboxregion(gridID, cornerlon, cornerlat);
regionID2 = HE5_GDdupregion(regionID);
regionID = HE5_GDdefvrtregion(gridID, regionID, "Pressure", rangePres);
regionID2 = HE5_GDdefvrtregion(gridID, regionID2, "Temperature", rangeTemp);
```

**FORTRAN**

```fortran
integer he5_gddupreg(oldregionid)
integer oldregionid
```

The equivalent FORTRAN code for the example above is:

```fortran
regionid = he5_gddefboxreg(gridid, cornerlon, cornerlat)
regionid2 = he5_gddupreg(regionid)
regionid = he5_gddefvrtreg(gridid, regionid, 'Pressure', rangePres)
regionid2 = he5_gddefvrtreg(gridid, regionid2, 'Temperature', rangeTemp)
```
Read a Region of interest from a Field

**HE5_GDextractregion**

```c
herr_t HE5_GDextractregion(hid_t gridID, hid_t regionID, const char *fieldname, void *buffer)
```

- **gridID** IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
- **regionID** IN: Region (period) ID returned by HE5_GDdefboxregion (HE5_GDdeftimeperiod)
- **fieldname** IN: Field to subset
- **buffer** OUT: Data Buffer

**Purpose** Extracts (reads) from subsetted region.

**Return value** Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

**Description** This routine reads data into the data buffer from a subsetted region as defined by HE5_GDdefboxregion.

**Example** In this example, we extract data from the Temperature field from the region defined in HE5_GDdefboxregion. We first allocate space for the data buffer. The size of the subsetted region for the field is given by the HE5_GDregioninfo routine.

```c
datbuf = (float *)calloc(size, sizeof(float));
status = HE5_GDextractregion(GDid, regionID, "Temperature", datbuf);
```

**FORTRAN** integer function he5_gdextreg(gridid, regionid, fieldname, datbuf)

```fortran
integer gridid
integer regionid
character(*) fieldname
<valid type> buffer(*)
```

The equivalent FORTRAN code for the example above is:

```fortran
status = he5_gdextreg(gridid, regionid, "Temperature", datbuf)
```
Retrieve Information about Data Field in a Grid

**HE5_GDfieldinfo**

```c
herr_t HE5_GDfieldinfo(hid_t gridID, const char *fieldname, int *rank, hsize_t dims[], H5T_class_t ntype[], char *dimlist, char *maxdimlist)
```

- **gridID**  
  IN: Grid ID returned by HE5_GDcreate or HE5_GDattach

- **fieldname**  
  IN: Fieldname

- **rank**  
  OUT: Pointer to rank of the field

- **dims**  
  OUT: Array containing the dimension sizes of the field

- **ntype**  
  OUT: Pointer to the numbertype of the field

- **dimlist**  
  OUT: Dimension list

- **maxdimlist**  
  OUT: Maximum dimensions allowed for field

**Purpose**
Retrieve information about a specific geolocation or data field in the grid.

**Return value**
Returns SUCCEED(0) if successful or FAIL(-1) otherwise. A typical reason for failure is the specified field does not exist.

**Description**
This routine retrieves information on a specific data field.

**Example**
In this example, we retrieve information about the Spectra data fields:

```c
status = HE5_GDfieldinfo(gridID, "Spectra", &rank, dims, &ntype, dimlist, maxdimlist);
```

The return parameters will have the following values:

- rank=3, ntype=1, dims[3]={15,200,120} and
- dimlist="Bands,YDim,XDim"

**FORTRAN**

```fortran
integer function he5_gdfldinfo(gridid, fieldname, rank, dims, ntype, dimlist, maxdimlist)
integer(gridid
character(*) fieldname
integer(*) rank
```
integer*4      d1ms(*)
integer       ntype(*)
character*(*)  dimlist
character*(*)  maxdimlist

The equivalent *FORTRAN* code for the example above is:

\[
\text{status} = \text{he5_gdfldinfo(gridid, "Spectra", d1ms, rank, ntype, dimlist, maxdimlist)}
\]

The return parameters will have the following values:

\[
\text{rank}=3, \text{ntype}=1, \text{d1ms}[3]=[120,200,15]\text{ and }
\text{dimlist}="XDim,YDim,Bands"
\]

Note that the dimensions array and the dimension list are in *FORTRAN* order.
Get External Data File Information

**HE5_GDgetextdata**

```c
int HE5_GDgetextdata(hid_t gridID, char *fieldname, size_t namelength, char *filelist, off_t offset[], hsize_t size[])
```

- **gridID**
  - **IN**: Grid ID returned by HE5_GDcreate or HE5_GDattach
- **fieldname**
  - **IN**: External field name
- **namelength**
  - **OUT**: Length of each name entry
- **filelist**
  - **OUT**: List of file names
- **offset[]**
  - **OUT**: Array of offsets (in byte) from the beginning of file to the location in file where the data starts
- **size[]**
  - **OUT**: Array of sizes (in bytes) reserved in the file for the data

**Purpose**
Retrieves information about external data file(s) associated with the data set.

**Return value**
Returns number of external data files if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper grid ID or field name.

**Example**
In this example, we get information about the `ExtData` field:

```c
nfiles = HE5_GDgetextdata(gridID, "ExtData", namlen, filenames, offset, size);
```

**FORTRAN**

```fortran
integer function he5_gdgetxdat(gridid,fieldname,nlen, fllist,offset, size)
integer gridid
integer nfiles
integer*4 nlen
integer*4 offset(*)
integer*4 size(*)
character(*) filename
character(*) flist
```

The equivalent **FORTRAN** code for the example above is:

```
nfiles = he5_gdgetxdat(gridid, "ExtData",nlen, fllist,offset, size)
```
Get Fill Value for Specified Field

**HE5_GDgetfillvalue**

```c
herr_t HE5_GDgetfillvalue(hid_t gridID, const char *fieldname, void *fillvalue)
```

- **gridID** IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
- **fieldname** IN: Fieldname
- **fillvalue** OUT: Space allocated to store the fill value

**Purpose**
Retrieves fill value for the specified field.

**Return value**
Returns SUCCEED(0) if successful or FAIL(-1) otherwise. Typical reasons for failure are an improper Grid ID or number type or incorrect fill value.

**Description**
It is assumed the number type of the fill value is the same as the field.

**Example**
In this example, we get the fill value for the *Temperature* field:

```c
status = HE5_GDgetfillvalue(gridID, "Temperature", &tempfill);
```

**FORTRAN**

```fortran
integer function he5_gdgetfill(gridid,fieldname,fillvalue)
integer gridid
character(*) fieldname
<valid type> fillvalue(*)
```

The equivalent **FORTRAN** code for the example above is:

```fortran
status = he5_gdgetfill(gridid, "Temperature", tempfill)
```
Get Row/Columns for Specified Longitude/Latitude Pairs

**HE5_GDgetpixels**

```c
herr_t HE5_GDgetpixels(hid_t gridID, long nLonLat, double lonVal[], double latVal[], long pixRow[], long pixCol[])
```

- **gridID** IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
- **nLonLat** IN: Number of longitude/latitude pairs
- **lonVal** IN: Longitude values in degrees
- **latVal** IN: Latitude values in degrees
- **pixRow** OUT: Pixel Rows
- **pixCol** OUT: Pixel Columns

**Purpose**

Returns the pixel rows and columns for specified longitude/latitude pairs.

**Return value**

Returns SUCCEED(0) if successful or FAIL(-1) otherwise.

**Description**

This routine converts longitude/latitude pairs into (0-based) pixel rows and columns. The origin is the upper left-hand corner of the grid. This routine is the pixel subsetting equivalent of **HE5_GDdefboxregion**.

**Example**

To convert two pairs of longitude/latitude values to rows and columns, make the following call:

```c
donArr[0] = 134.2;
latArr[0] = -20.8;
donArr[1] = 15.8;
latArr[1] = 84.6;
status = HE5_GDgetpixels(gridID, 2, lonArr, latArr, rowArr, colArr);
```

The row and column of the two pairs will be returned in the `rowArr` and `colArr` arrays.
FORTRAN  

integer function he5_gdgetpix(gridid, nlonlat, lonval, latval, pixrow, pixcol)

  integer     gridid
  integer*4   nlonlat
  real*8      lonval(*)
  real*8      latval(*)
  integer*4   pixrow(*)
  integer*4   pixcol(*)

The equivalent FORTRAN code for the example above is:

  lonarr(1) = 134.2
  latarr(1) = -20.8
  lonarr(2) = 15.8
  latarr(2) = 84.6
  nlonlat   = 2
  status = he5_gdgetpix(gridid, nlonlat, lonarr, latarr, rowarr, colarr)

Note that the row and columns values will be 1-based.
Get Field Values for Specified Row/Columns

**HE5_GDgetpixvalues**

long HE5_GDgetpixvalues(hid_t gridID, long nPixels, long pixRow[], long pixCol[], const char *fieldname, void *buffer)

- **gridID** IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
- **nPixels** IN: Number of pixels
- **pixRow** IN: Pixel Rows
- **pixCol** IN: Pixel Columns
- **fieldname** IN: Field from which to extract data values
- **buffer** OUT: Buffer for data values

**Purpose** Read field data values for specified pixels.

**Return value** Returns size of data buffer if successful or FAIL(-1) otherwise.

**Description** This routine reads data from a data field for the specified pixels. It is the pixel subsetting equivalent of HE5_GDextractregion. All entries along the non-geographic dimensions (ie, NOT XDim and YDim) are returned. If the buffer is set to NULL, no data is returned but the data buffer size can be determined from the function return value.

**Example** To read values from the Spectra field with dimensions, Bands, YDim, and XDim, make the following call:

```c
double *datbuf;

bufsz = HE5_GDgetpixvalues(gridID, 2, rowArr, colArr, "Spectra", NULL);

/* bufsiz will be equal to 2 * NBANDS * 8 where NBANDS is the value for the Bands dimension */

datbuf = (double *)calloc(bufsz, sizeof(double));

bufsz = HE5_GDgetpixvalues(gridID, 2, rowArr, colArr, "Spectra", datbuf);
```
FORTRAN 4 function he5_gdgetpixval(gridid, npixels, pixrow, pixcol, fieldname, buffer)

integer     gridid
integer*4   npixels
integer*4   bufsiz
integer*4   pixrow(*)
integer*4   pixcol(*)

character(*) fieldname
<valid type> buffer(*)

The equivalent FORTRAN code for the example above is:

real*8      datbuf(2,NBANDS)
npixels = 2

bufsiz = he5_gdgetpixval(gridid, npixels, rowarr, colarr, "Spectra", datbuf)
Return Information about a Grid Structure

**HE5_GDgridinfo**

```c
herr_t HE5_GDgridinfo(hid_t gridID, long *xdimsize, long *ydimsize, double upleftpt[], double lowrightpt[])
```

- **gridID** IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
- **xdimsize** OUT: Number of columns in grid
- **ydimsize** OUT: Number of rows in grid
- **upleftpt** OUT: Location, in meters, of upper left corner
- **lowrightpt** OUT: Location, in meters, of lower right corner

**Purpose**
Returns position and size of grid

**Return value**
Returns SUCCEED(0) if successful or FAIL(-1) otherwise

**Description**
This routine returns the number of rows, columns and the location, in meters, of the upper left and lower right corners of the grid image.

**Example**
In this example, we retrieve information from a previously created grid with a call to `HE5_GDattach`:

```c
status = HE5_GDgridinfo(gridID, &xdimsize, &ydimsize, upleft, lowrgt);
```

**FORTRAN**

```fortran
integer function he5_gdgridinfo(gridid, xdimsize, ydimsize, upleftpt, lowrightpt)
  integer(gridid
  integer*4(xdimsize
  integer*4(ydimsize
  real*8(upleftpt(2)
  real*8(lowrightpt(2)
```

The equivalent FORTRAN code for the example above is:

```fortran
status = he5_gdgridinfo(gridid, xdimsize, ydimsize, upleft, lowrgt)
```
Return Information about a Group Grid Attribute

HE5_GDgrpattrinfo

herr_t HE5_GDgrpattrinfo(hid_t gridID, const char *attrname, H5T_class_t *ntype, hsize_t *count)

gridID      IN:  Grid ID returned by HE5_GDcreate or HE5_GDattach
attrname    IN:  Attribute name
ntype       OUT: Data type class ID of attribute
count       OUT: Number of attribute elements

Purpose     Returns information about a swath group attribute
Return value Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

Description This routine returns number type and number of elements (count) of a swath group attribute.

Example     In this example, we return information about the ScalarFloat attribute.

status = HE5_GDgrpattrinfo(gridID, "ScalarFloat", &ntype, &count);

The ntype variable will have the value 1 and count will have the value 1.

FORTRAN    integer function he5_gdgattrinfo(gridid, attrname, ntype, count,)
            integer      gridid
            character(*) attrname
            integer      ntype
            integer *4   count

The equivalent FORTRAN code for the first example above is:

status = he5_gdgattrinfo(gridid, "ScalarFloat", ntype, count)
Retrieve Information about Grid Attributes

**HE5_GDInqattrs**

long HE5_GDInqattrs(hid_t gridID, char *attrnames, long *strbufsize)

- **gridID** (IN): Grid ID returned by HE5_GDcreate or HE5_GDattach
- **attrnames** (OUT): Attribute list (entries separated by commas)
- **strbufsize** (OUT): String length of attribute list

**Purpose**: Retrieve information about attributes defined in grid.

**Return value**: Number of attributes found if successful or FAIL (-1) otherwise.

**Description**: The attribute list is returned as a string with each attribute name separated by commas. If `attrnames` is set to NULL, then the routine will return just the string buffer size, `strbufsize`. This variable does not count the null string terminator.

**Example**: In this example, we retrieve information about the attributes defined in a grid structure. We assume that there are two attributes stored, `attrOne` and `attr_2`:

```c
nattr = HE5_GDInqattrs(gridID, NULL, strbufsize);
```

The parameter, `nattr`, will have the value 2 and `strbufsize` will have value 14.

```c
nattr = HE5_GDInqattrs(gridID, attrnames, strbufsize);
```

The variable, `attrlist`, will be set to:

"`attrOne,attr_2`".

**FORTRAN**

integer*4 function he5_gdinqattrs(gridid,attrnames,strbufsize)

```fortran
integer        gridid
character(*)   attrnames
integer*4      strbufsize
```

The equivalent **FORTRAN** code for the example above is:

```fortran
nattr = he5_gdinqattrs(gridid, attrnames, strbufsize)
```
Retrieve Information about Dimensions Defined in Grid

**HE5_GDinqdims**

```c
int HE5_GDinqdims(hid_t gridID, char *dimnames, hsize_t dims[])
```

- **gridID**  
  IN: Grid ID returned by HE5_GDcreate or HE5_GDattach

- **dimnames**  
  OUT: Dimension list (entries separated by commas)

- **dims**  
  OUT: Array containing size of each dimension

**Purpose**  
Retrieve information about dimensions defined in grid.

**Return value**  
Number of dimension entries found if successful or FAIL(-1) otherwise. A typical reason for failure is an improper grid id.

**Description**  
The dimension list is returned as a string with each dimension name separated by commas. Output parameters set to NULL will not be returned.

**Example**  
To retrieve information about the dimensions, use the following statement:

```c
ndim = HE5_GDinqdims(gridID, dimnames, dims);
```

The parameter, `dimnames`, will have the value: "Xgrid,Ygrid,Bands"

with `dims[3] = {120,200,15}`

**FORTRAN**  
integer function he5_gdinqdims(gridid,dimnames,dims)

```fortran
integer gridid
character(*) dimnames
integer*4 dims(*)
```

The equivalent FORTRAN code for the example above is:

```fortran
ndim = he5_gdinqdims(gridid, dimnames, dims)
```
Retrieve Information about Data Fields Defined in Grid

HE5_GDinqfields

int HE5_GDinqfields(hid_t gridID, char *fieldlist, int rank[], H5T_class_t ntype[])  

gridID  IN: Grid ID returned by HE5_GDcreate or HE5_GDattach  
fieldlist  OUT: Listing of data fields (entries separated by commas)  
rank  OUT: Array containing the rank of each data field  
numbertype  OUT: Array containing the numbertype of each data field  

Purpose Retrieve information about the data fields defined in grid.  

Return value Number of data fields found if successful or FAIL(-1) otherwise. A typical reason is an improper grid id.  

Description The field list is returned as a string with each data field separated by commas. The rank and numbertype arrays will have an entry for each field. Output parameters set to NULL will not be returned.  

Example To retrieve information about the data fields, use the following statement:  
nfld = HE5_GDinqfields(gridID, fieldlist, rank, numbertype);  
The parameter, fieldlist, will have the value: "Temperature,Spectra" with rank[2]={2,3}, numbertype[2]={1,1}  

FORTRAN integer function he5_gdinqdflds(gridid, fieldlist, rank, numbertype)  

integer gridid  
character*(*) fieldlist  
integer rank(*)  
integer numbertype(*)  
The equivalent FORTRAN code for the example above is:  
nfld = he5_gdinqdflds(gridID, fieldlist, rank, numbertype)  
The parameter, fieldlist, will have the value: "Spectra,Temperature" with rank[2]={3,2}, numbertype[2]={1,1}  

Retrieve Grid Structures Defined in HDF-EOS File

HE5_GDinqgrid

long HE5_GDinqgrid(const char *filename, char *gridlist, long *strbufsize)

**filename**  
IN: HDF-EOS file name

**gridlist**  
OUT: Grid list (entries separated by commas)

**strbufsize**  
OUT: String length of grid list

**Purpose**  
Retrieves number and names of grids defined in HDF-EOS file.

**Return value**  
Number of grids found of successful or FAIL (-1) otherwise.

**Description**  
The grid list is returned as a string with each grid name separated by commas. If *gridlist* is set to NULL, then the routine will return just the string buffer size, *strbufsize*. If *strbufsize* is also set to NULL, the routine returns just the number of grids. Note that *strbufsize* does not count the null string terminator.

**Example**  
In this example, we retrieve information about the grids defined in an HDF-EOS file, *Grid.he5*. We assume that there are two grids stored, *GridOne* and *Grid_2*:

```c
ngrid = HE5_GDinqgrid("Grid.he5", NULL, strbufsize);
```

The parameter, *ngrid*, will have the value 2 and *strbufsize* will have value 16.

```c
ngrid = HE5_GDinqgrid("Grid.he5", gridlist, strbufsize);
```

The variable, *gridlist*, will be set to:

"GridOne,Grid_2".

**FORTRAN**

integer*4 function he5_gdinqgrid(filename,gridlist,strbufsize)

ccharacter*(*) filename
ccharacter*(*) gridlist
cinteger*4 strbufsize

The equivalent FORTRAN code for the example above is:

```fortran
ngrid = he5_gdinqgrid('Grid.he5', gridlist, strbufsize)
```
Retrieve Information Grid Group Attributes

HE5_GDinqgrppattrs

long HE5_GDinqgrppattrs(hid_t gridID, char *attrnames, long *strbufsize)

gridID  IN:  Grid ID returned by HE5_GDcreate or HE5_GDattach
attrnames  OUT:  Attribute list (entries separated by commas)
strbufsize  OUT:  String length of attribute list

Purpose  Retrieve information about group attributes defined in grid.
Return value  Number of attributes found if successful or FAIL (-1) otherwise.

Description  The attribute list is returned as a string with each group attribute name separated by commas. If attrlist is set to NULL, then the routine will return just the string buffer size, strbufsize. This variable does not count the null string terminator.

Example  In this example, we retrieve information about the group attributes defined for the “Data Fields” group. We assume that there are two attributes stored, attrOne and attr_2:

nattr = HE5_GDinqgrppattrs(gridID, NULL, &strbufsize);

The parameter, nattr, will have the value 2 and strbufsize will have value 14.

nattr = HE5_GDinqgrppattrs(gridID, attrnames, &strbufsize);

The variable, attrlist, will be set to:

"attrOne,attr_2".

FORTRAN  integer*4 function he5_gdinqgrppatts(gridid, attrnames, strbufsize)

integer  gridid
character(*)  attrnames
integer(*)  strbufsize

The equivalent FORTRAN code for the example above is:

nattr = he5_gdinqgrppatts(gridid, attrnames, strbufsize)
Retrieve Information Grid Local Attributes

**HE5_GDinqlocattrs**

```c
long HE5_GDinqlocattrs(hid_t gridID, const char *fieldname, char *attrnames, long *strbufsize)
```

- **gridID** (IN): Grid ID returned by HE5_GDcreate or HE5_GDattach
- **fieldname** (IN): Fieldname to retrieve local attribute information
- **attrnames** (OUT): Attribute list (entries separated by commas)
- **strbufsize** (OUT): String length of attribute list

**Purpose**: Retrieve information about local attributes defined for a field.

**Return value**: Number of attributes found if successful or FAIL (-1) otherwise.

**Description**: The attribute list is returned as a string with each local attribute name separated by commas. If `attrnames` is set to NULL, then the routine will return just the string buffer size, `strbufsize`. This variable does not count the null string terminator.

**Example**

In this example, we retrieve information about the local attributes defined for a field “DataField”. We assume that there are two attributes stored, `attrOne` and `attr_2`:

```c
nattr = HE5_GDinqlocattrs(gridID, “DataField”, NULL, &strbufsize);
```

The parameter, `nattr`, will have the value 2 and `strbufsize` will have value 14.

```c
nattr = HE5_GDinqlocattrs(gridID, “DataField”, attrnames, &strbufsize);
```

The variable, `attrnames`, will be set to:

```
"attrOne,attr_2".
```

**FORTRAN**

```fortran
integer*4 function he5_gdinqlattrs(gridid, fieldname, attrnames, strbufsize)
```

```fortran
integer gridid
character(*) fieldname
character(*) attrnames
```
integer*4    strbufsize

The equivalent FORTRAN code for the example above is:

nattr = he5_gdinqlattrs(gridid, "DataField", attrnames, strbufsize)
Perform Bilinear Interpolation on Grid Field

HE5_GDinterpolate

long HE5_GDinterpolate(hid_t gridID, long nValues, double lonVal[], double latVal[], const char *fieldname, double interpVal[])

gridID IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
nValues IN: Number of interpolation points
lonVal IN: Longitude of interpolation points
latVal IN: Latitude of interpolation points
fieldname OUT: Field from which to interpolate data values
interpVal OUT: Buffer for interpolated data values
Purpose Performs bilinear interpolation on a grid field.

Return value Returns size in bytes of interpolated data values if successful or FAIL(-1) otherwise.

Description This routine performs bilinear interpolation on a grid field. It assumes that the pixel data values are uniformly spaced which is strictly true only for an infinitesimally small region of the globe but is a good approximation for a sufficiently small region. The default position of the pixel value is pixel center, however if the pixel registration has been set to HDFE_CORNER (with the HE5_GDdefpixreg routine) then the value is located at one of the four corners (HE5_HDFE_GD_UL, _UR, _LL, _LR) specified by the HE5_GDdeforigin routine. All entries along the non-geographic dimensions (ie, NOT XDim and YDim) are interpolated and all interpolated values are returned as DOUBLE. The data buffer size can be determined by setting the interpVal parameter to NULL. The reference for the interpolation algorithm is Numerical Recipes in C (2nd ed). (Note for the current version of this routine, the number type of the field to be interpolated is restricted to INT, LONG, FLOAT, DOUBLE.)

Example To interpolate the Spectra field at two geographic data points:

lonVal[0] = 134.2;
latVal[0] = -20.8;
lonVal[1] = 15.8;
latVal[1] = 84.6;
double   *interVal;

bufsiz = HE5_GDinterpolate(gridID, 2, lonVal, latVal, "Spectra", NULL);

/* bufsiz will be equal to 2 * NBANDS * 8 where NBANDS is the value for the Bands dimension */

interpVal = (double *)calloc(bufsiz, sizeof(double));

bufsiz = HE5_GDinterpolate(gridID, 2, lonVal, latVal, "Spectra", interpVal);

FORTRAN

integer*4 function he5_gdinterpolate(gridid, ninterp, lonval, latval, fieldname, interpval)

integer             gridid
integer*4           ninterp
real*8              lonval(*)
real*8              latval(*)
character(*)        fieldname
real*8              interpval(*)

The equivalent FORTRAN code for the example above is:

real*8              interpval(NBANDS, 2)

ninterp = 2

bufsiz = he5_gdinterpolate(gridid, ninterp, lonval, latval, "Spectra", interpval)
Return Information about a Local Grid Attribute

HE5_GDlocattrinfo

herr_t HE5_GDlocattrinfo(hid_t gridID, const char *fieldname, const char *attrname, H5T_class_t *ntype, hsize_t *count)

gridID IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
fieldname IN: Field name
attrname OUT: Attribute list
numbertype OUT: Data type class ID of attribute
count OUT: Number of attribute elements

Purpose Returns information about a Data Field’s local attribute(s)

Return value Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

Description This routine returns number type and number of elements (count) of a data field’s local attribute(s).

Example In this example, we return information about the ScalarFloat attribute.

status = HE5_GDlocattrinfo(gridID, "DataField", attrname, &ntype, &count);

The ntype variable will have the value 1 and count will have the value 1.

FORTRAN integer function he5_gdlattrinfo(gridid, fieldname, attrname, ntype, count)
integer gridid
character(*) fieldname
character(*) attrname
integer ntype
integer *4 count

The equivalent FORTRAN code for the first example above is:

status = he5_gdlattrinfo(gridid, "DataField", attrname, ntype, count)
Return Number of specified Objects in a Grid

**HE5_GDnentries**

```c
long HE5_GDnentries(hid_t gridID, int entrycode, long *strbufsize)
```

**gridID**
IN: Grid ID returned by HE5_GDcreate or HE5_GDattach

**entrycode**
IN: Entry code

**strbufsize**
OUT: String buffer size

**Purpose**
Returns number of entries and descriptive string buffer size for a specified entity.

**Return value**
Number of entries if successful or FAIL(-1) otherwise. A typical reason for failure is an improper Grid ID or entry code.

**Description**
This routine can be called before using the inquiry routines in order to determine the sizes of the output arrays and descriptive strings. The string length does not include the NULL terminator.

The entry codes are:
- HE5_HDFE_NENTDIM (0) - Dimensions
- HE5_HDFE_NENTDFLD (4) - Data Fields

**Example**
In this example, we determine the number of data field entries and the size of the field list string.

```
ndims = HE5_GDnentries(gridID, HE5_HDFE_NENTDFLD, &bufsize);
```

**FORTRAN**

```fortran
integer*4 function he5_gdnentries(gridid,entrycode, bufsize)
integer gridid
integer entrycode
integer*4 bufsize
```

The equivalent **FORTRAN** code for the example above is:

```
entrycode = 4
ndims = he5_gdnentries(gridid, entrycode, bufsize)
```
Open HDF-EOS File

HE5_GDopen

hid_t HE5_GDopen(const char *filename, uintn access)

filename IN: Complete path and filename for the file to be opened
access IN: H5F_ACC_RDONLY, H5F_ACC_RDWR or H5F_ACC_TRUNC

Purpose Opens or creates HDF file in order to create, read, or write a grid.

Return value Returns the grid file ID handle(fid) if successful or FAIL(-1) otherwise.

Description This routine creates a new file or opens an existing one, depending on the access parameter.

Access codes:

H5F_ACC_RDONLY Open for read only. If file does not exist, error

H5F_ACC_RDWR Open for read/write. If file does not exist, create it

H5F_ACC_TRUNC If file exists, delete it, then open a new file for read/write

Example In this example, we create a new grid file named, Grid.he5. It returns the file handle, fid.

fid = HE5_GDopen("Grid.he5", H5F_ACC_TRUNC);

FORTRAN integer function he5_gdopen(filename, access)
character*(*) filename
integer access

The access codes should be defined as parameters:
parameter (HE5_HDFE_RDWR=0)
parameter (HE5_HDFE_RDONLY=1)
parameter (HE5_HDFE_TRUNC=2)

The equivalent FORTRAN code for the example above is:

fid = he5_gdopen("Grid.he5", HE5_HDFE_TRUNC)
Note to users of the SDP Toolkit: Please refer to the Release 5B SDP Toolkit User Guide for the ECS Project (333-CD-510-001), Section 6.2.1.2 for information on how to obtain a file name (referred to as a "physical file handle") from within a PGE. See also Section 9 of this document for code examples.
Return Grid Origin Information

**HE5_GDorigininfo**

```c
herr_t HE5_GDorigininfo(hid_t gridID, int *origincode)
```

**gridID**

*IN:* Grid ID returned by HE5_GDcreate or HE5_GDattach

**origincode**

*IN:* Origin code

**Purpose**

Retrieve origin code.

**Return value**

Origin code if successful or FAIL (-1) otherwise.

**Description**

This routine retrieves the origin code.

**Example**

In this example, we retrieve the origin code defined in HE5_GDdeforigin.

```c
status = HE5_GDorigininfo(gridID, &origincode);
```

The return value, `origincode`, will be equal to 3

**FORTRAN**

```fortran
integer function he5_gdorginfo(gridid,origincde)
    integer gridid
    integer(*) origincode

    The equivalent FORTRAN code for the above example is :

    status = he5_gdorginfo(gridid, origincode)
```

Return Pixel Registration Information

HE5_GDpixreginfo

herr_t HE5_GDpixreginfo(hid_t gridID, int *pixregcode)

gridID       IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
pixregcode   IN: Pixel registration code

Purpose Retrieve pixel registration code.
Return value Pixel registration code if successful or FAIL (-1) otherwise.
Description This routine retrieves the pixel registration code.
Example In this example, we retrieve the pixel registration code defined in HE5_GDdefpixreg.

status = HE5_GDpixreginfo(gridID, &pixregcode);

The return value, pixregcode, will be equal to 1

FORTRAN integer function he5_gdpreginfo(gridid, pixregcode)

integer        gridid
integer(*)     pixregcode

The equivalent FORTRAN code for the above example is:

status = he5_gdpreginfo(gridid, pixregcode)
Retrieve Grid Projection Information

**HE5_GDprojinfo**

```c
herr_t HE5_GDprojinfo(hid_t gridID, int *projcode, int *zonecode, int *spherecode, double projparm[])
```

- **gridID**  
  IN: Grid ID returned by HE5_GDcreate or HE5_GDattach

- **projcode**  
  OUT: GCTP projection code

- **zonecode**  
  OUT: GCTP zone code used by UTM projection

- **spherecode**  
  OUT: GCTP spheroid code

- **projparm**  
  OUT: GCTP projection parameter array

**Purpose**
Retrieves projection information of grid

**Return Value**
Returns SUCCEED(0) if successful or FAIL(-1) otherwise

**Description**
Retrieves the GCTP projection code, zone code, spheroid code and the projection parameters of the grid

**Example**
In this example, we are retrieving the projection information from a grid attached to with HE5_GDattached:

```c
status = HE5_GDprojinfo(gridID, &projcode, &zonecode, &spherecode, projparm);
```

**FORTRAN**

```fortran
integer function he5_gdprojinfo( gridid, projcode, zonecode, spherecode, projparm)
integer(*)     gridid
integer(*)     projcode
integer(*)     zonecode
integer(*)     spherecode
real*8         projparm(*)
```

The equivalent FORTRAN code for the example above is:

```fortran
status = he5_gdprojinfo(gridid, projcode, zonecode, spherecode, projparm)
```
Read Grid Attribute

HE5_GDreadattr

herr_t HE5_GDreadattr(hid_t gridID, const char *attrname, void *datbuf)

gridID IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
attrname IN: Attribute name
datbuf OUT: Buffer allocated to hold attribute values

Purpose Reads attribute from a grid.

Return value Returns SUCCEED(0) if successful or FAIL(-1) otherwise. Typical reasons for failure are an improper grid id or number type or incorrect attribute name.

Description The attribute is passed by reference rather than value in order that a single routine suffice for all numerical types.

Example In this example, we read a floating point attribute with the name "ScalarFloat":

status = HE5_GDreadattr(gridID, "ScalarFloat", &attr_val);

FORTRAN integer function he5_gdrdattr(gridid, attrname, datbuf)

integer gridid
character(*) attrname
<valid type> attrval(*)

The equivalent FORTRAN code for the example above is:

status = he5_gdrdattr(gridid, "ScalarFloat", attrval)
Read Data From a Grid Field

**HE5_GDreadfield**

```c
herr_t HE5_GDreadfield(hid_t gridID, const char *fieldname, const hssize_t *start[], const hsize_t *stride[], const hsize_t *edge[], void *buffer)
```

- **gridID** IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
- **fieldname** IN: Name of field to read
- **start** IN: Array specifying the starting location within each dimension
- **stride** IN: Array specifying the number of values to skip along each dimension
- **edge** IN: Array specifying the number of values to write along each dimension
- **buffer** IN: Buffer to store the data read from the field

**Purpose**
Reads data from a grid field.

**Return value**
Returns SUCCEED(0) if successful or FAIL(-1) otherwise. Typical reasons for failure are improper Grid ID of unknown fieldname.

**Description**
The values within `start`, `stride`, and `edge` arrays refer to the grid field (input) dimensions. The output data in `buffer` is written to contiguously. The default values for `start` and `stride` are 0 and 1 respectively and are used if these parameters are set to `NULL`. The default values for `edge` are 

\[(\text{dim} - \text{start}) / \text{stride} \]\n
where `dim` refers to the size of the dimension.

**Example**
In this example, we read data from the 10th row (0-based) of the `Temperature` field.

```c
float row[120];

hssize_t start[2]={10,1}; hsize_t edge[2]={1,120};

status = HE5_GDreadfield(gridID, "Temperature", start, NULL, edge, row);
```
FORTRAN  integer function 
he5_gdrdfld(gridid,fieldname,start,stride,edge,buffer) 
integer   gridid 
character*(*)  fieldname 
integer*4   start(*) 
integer*4   stride(*) 
integer*4   edge(*) 
<valid type>  buffer(*) 
The start, stride, and edge arrays must be defined explicitly, with the start array being 0-based.
The equivalent FORTRAN code for the example above is:
real*4  row(2000)
integer*4  start(2), stride(2), edge(2)
start(1)  = 10
start(2)  = 0
stride(1) = 1
stride(2) = 1
edge(1)  = 2000
edge(2)  = 1
status = he5_gdrdfld(gridid, "Temperature", start, stride, edge, row)
HE5_GDreadgrpattr

herr_t HE5_GDreadgrpattr(hid_t gridID, const char *attrname, void *datbuf)

- **gridID**: IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
- **attrname**: IN: Attribute name
- **datbuf**: OUT: Buffer allocated to hold attribute values

**Purpose**
Reads attribute from a grid.

**Return value**
Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper grid id or number type or incorrect attribute name.

**Description**
The attribute is passed by reference rather than value in order that a single routine suffice for all numerical types.

**Example**
In this example, we read a floating point attribute with the name "ScalarFloat":
```
status = HE5_GDreadgrpattr(gridID, "ScalarFloat", attr_val);
```

**FORTRAN**
integer function he5_gdrdgattr(gridid, attrname, datbuf)

integer gridid
character(*) attrname
<valid type> attrval(*)

The equivalent FORTRAN code for the example above is:
```
status = he5_gdrdgattr(gridid, "ScalarFloat", attrval)
```
# Read Local Grid Attribute

**HE5_GDreadlocattr**

```c
herr_t HE5_GDreadlocattr(hid_t gridID, const char *fieldname, const char *attrname, void *datbuf)
```

- **gridID** IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
- **fieldname** IN: Field name
- **attrname** IN: Attribute name
- **datbuf** OUT: Buffer allocated to hold attribute values

**Purpose**
Reads attribute from a grid.

**Return value**
Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper Grid ID or number type or incorrect attribute name.

**Description**
The attribute is passed by reference rather than value in order that a single routine suffice for all numerical types.

**Example**
In this example, we read a floating point attribute with the name "ScalarFloat":

```c
status = HE5_GDreadlocattr(gridID, "DataField", "ScalarFloat", &attr_val);
```

**FORTRAN**

```fortran
integer function he5_gdrdlattr(gridid, fieldname, attrname, datbuf)
integer gridid
character*(*) fieldname
character*(*) attrname
<valid type> attrval(*)
```

The equivalent *FORTRAN* code for the example above is:

```fortran
status = he5_gdrdlattr(gridid, "DataField", "ScalarFloat", attrval)
```
Return Information about a Region

**HE5_GDregioninfo**

```c
herr_t HE5_GDregioninfo(hid_t gridID, hid_t regionID, const char *fieldname, H5T_class_t *ntype, int *rank, hsize_t dims[], long *size, double upleftpt[], double lowrightpt[])
```

- **gridID** IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
- **regionID** IN: Region (period) ID returned by HE5_GDdefboxregion (HE5_GDdeftimeperiod)
- **fieldname** IN: Field to subset
- **ntype** OUT: Number type of field
- **rank** OUT: Rank of field
- **dims** OUT: Dimensions of subset region
- **size** OUT: Size in bytes of subset region
- **upleftpt** OUT: Upper left point of subset region
- **lowrightpt** OUT: Lower right point of subset region

**Purpose**
Retrieves information about the subsetted region.

**Return value**
Returns SUCCEED (0) if successful or FAIL (-1) otherwise.

**Description**
This routine returns information about a subsetted region for a particular field. It is useful when allocating space for a data buffer for the region. Because of differences in number type and geolocation mapping, a given region will give different values for the dimensions and size for various fields. The `upleftpt` and `lowrightpt` arrays can be used when creating a new grid from the subsetted region.

**Example**
In this example, we retrieve information about the region defined in `HE5_GDdefboxregion` for the `Temperature` field. We use this to allocate space for data in the subsetted region.

```c
status = HE5_GDregioninfo(GDid, regionID, "Temperature", &ntype, &rank, dims, &size, upleft, lowright);
```
integer function he5_gdreginfo(gridid, regionid, fieldname, ntype, rank, dims, size, upleftpt, lowrightpt)

  integer          gridid
  integer          gridid
  character(*)     fieldname
  integer          ntype
  integer          rank
  integer*4        dims(*)
  integer*4        size
  real*8           upleftpt(2)
  real*8           lowrightpt(2)

The equivalent FORTRAN code for the example above is:

    status = he5_gdreginfo(gridid, regid, "Spectra", ntype, rank, dims, size, upleftpt, lowrightpt)
Set External Data File(s)

HE5_GDsetextdata

herr_t HE5_GDsetextdata(hid_t gridID, const char *filelist, off_t offset[], hsize_t size[])

gridID IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
filelist IN: List of external file names
offset[] IN: Array of offsets (in byte) from the beginning of file to the location in file where the data starts
size[] IN: Array of sizes (in bytes) reserved in the file for the data

Purpose Sets the external data file(s) associated with the data set.

Return value Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper grid ID.

Example In this example, we set the ExtData field:

```c
status = HE5_GDsetextdata(gridID, "ext-1.dat,ext-2.dat,ext-3.dat", offset, size);
```

FORTRAN integer function he5_gdsetxdat(gridid,flist,offset,size)

```fortran
integer gridid
integer status
integer*4 offset(*)
integer*4 size(*)
character*(*) flist
```

The equivalent FORTRAN code for the example above is:

```fortran
status = he5_gdsetxdat(gridid,flist,offset,size)
```
Set Fill Value for a Specified Field

**HE5_GDsetfillvalue**

```
herr_t HE5_GDsetfillvalue(hid_t gridID, const char *fieldname, hid_t ntype, void *fillvalue)
```

- **gridID**
  - IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
- **fieldname**
  - IN: Fieldname
- **ntype**
  - IN: Data type of fill value
- **fillvalue**
  - IN: Pointer to the fill value to be used

**Purpose**
Sets fill value for the specified field.

**NOTE:**
THIS FUNCTION MUST BE CALLED BEFORE THE FUNCTION CALL TO DEFINE THE FIELD IT IS TO BE APPLIED

**Return value**
Returns SUCCEED(0) if successful or FAIL(-1) otherwise. Typical reasons for failure are an improper grid id or number type.

**Description**
The fill value is placed in all elements of the field which have not been explicitly defined.

**Example**
In this example, we set a fill value for the *Temperature* field:
```
tempfill = -999.0;
status = HE5_GDsetfillvalue(gridID, "Temperature", ntype, &tempfill);
```

**FORTRAN**
integer function
```
he5_gdsetfill(gridid,fieldname,ntype,fillvalue)
```

- integer*4    gridid
- character(*)  fieldname
- integer      ntype
- <valid type> fillvalue(*)

The equivalent *FORTRAN* code for the example above is:
```
fillvalue = -999.0
status = he5_gdsetfill(gridid, "Temperature", ntype, fillvalue)
```
Write/Update Grid Attribute

**HE5_GDwriteattr**

```c
herr_t HE5_GDwriteattr(hid_t gridID, const char *attrname, hid_t ntype, hsize_t count[], void *datbuf)
```

- `gridID` **IN**: Grid ID returned by HE5_GDcreate or HE5_GDattach
- `attrname` **IN**: Attribute name
- `ntype` **IN**: Number type of attribute
- `count` **IN**: Number of values to store in attribute
- `datbuf` **IN**: Attribute values

**Purpose**
Writes/Updates attribute in a grid.

**Return value**
Returns SUCCEED(0) if successful or FAIL(-1) otherwise. Typical reasons for failure are an improper grid id or number type.

**Description**
If the attribute does not exist, it is created. If it does exist, then the value(s) is (are) updated. The attribute is passed by reference rather than value in order that a single routine suffice for all numerical types. Because of this a literal numerical expression should not be used in the call.

**Example**
In this example, we write a floating point number with the name "ScalarFloat" and the value 3.14:

```c
attr_val = 3.14;
count[0] = 1;
status=HE5_GDwriteattr(gridid,"ScalarFloat",H5T_NATIVE_FLOAT , count, &attr_val);
```

We can update this value by simply calling the routine again with the new value:

```c
attr_val = 3.14159;
status=HE5_GDwriteattr(gridid,"ScalarFloat",H5T_NATIVE_FLOAT , count, &attr_val);
```
FORTRAN  

integer function he5_gdwrattr(gridid, attrname, 
            ntype, count, datbuf)

integer         gridid
character(*)    attrname
integer         ntype
integer*4       count(*)
<valid type>    attrval(*)

The equivalent _FORTRAN_ code for the first example above is:

parameter (HE5_HDFE_NATIVE_FLOAT=1)

attrval = 3.14
count(1)= 1

status=he5_gdwrattr(gridid,"ScalarFloat",HE5_HDFE_NATIVE_FLOAT, count, attrval)
Write Data to a Grid Field

HE5_GDwritefield

herr_t HE5_GDwritefield(hid_t gridID, const char *fieldname, const hssize_t *start[], const hsize_t *stride[], const hsize_t *edge[], void *data)

gridID IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
fieldname IN: Name of field to write
start IN: Array specifying the starting location within each dimension (0-based)
stride IN: Array specifying the number of values to skip along each dimension
edge IN: Array specifying the number of values to write along each dimension
data IN: Values to be written to the field

Purpose Writes data to a grid field.
Return value Returns SUCCEED(0) if successful or FAIL(-1) otherwise.

Description The values within start, stride, and edge arrays refer to the grid field (output) dimensions. The input data in the data buffer is read from contiguously. The default values for start and stride are 0 and 1 respectively and are used if these parameters are set to NULL. The default values for edge are (dim - start) / stride where dim refers to the size of the dimension. Note that the data buffer for a compressed field must be the size of the entire field as incremental writes are not supported by the underlying HDF routines. If this is not possible due to, for example, memory limitations, then the user should consider tiling. See HE5_GDdeftile for further information.

Example In this example, we write data to the Temperature field.
float temperature[200][120];
/* Define elements of temperature array */
status = HE5_GDwritefield(gridID, "Temperature", NULL, NULL, NULL, temperature);

We now update Row 10 (0 - based) in this field:
float newrow[200];

/* Define elements of newrow array */
status = HE5_GDwritefield(gridID, "Temperature", start, NULL,
edge, newrow);

FORTRAN integer function he5_gdwrfld(gridid,fieldname,start,stride,edge,data)

integer gridid
character(*) filename
integer*4 start(*)
integer*4 stride(*)
integer*4 edge(*)
<valid type> data(*)

The start, stride, and edge arrays must be defined explicitly, with the start
array being 0-based.

The equivalent FORTRAN code for the example above is:
real*4 temperature(2000,1000)
integer*4 start(2), stride(2), edge(2)
start(1) = 0
start(2) = 0
stride(1) = 1
stride(2) = 1
edge(1) = 2000
edge(2) = 1000
status = he5_gdwrfld(gridid, "Temperature", start, stride,
edge, temperature)

We now update Row 10 (0-based) in this field:
real*4 newrow(2000)
integer*4 start(2), stride(2), edge(2)
start(1) = 10
start(2) = 0
stride(1) = 1
stride(2) = 1
edge(1) = 2000
edge(2) = 1
status = he5_gdwrfld(gridid, "Temperature", start, stride,
edge, newrow)
Write Field Metadata for an Existing Field not Defined with the Grid API

**HE5_GDwritefieldmeta**

```c
herr_t HE5_GDwritefieldmeta(hid_t gridID, const char *fieldname, char *dimlist, int ntype)
```

- **gridID** IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
- **fieldname** IN: Name of field that metadata information is to be written
- **dimlist** IN: Dimension list of field
- **ntype** IN: Number type of data in field

**Purpose**

Writes field metadata for an existing grid field not defined with the Grid API

**Return Value**

Returns SUCCEED(0) if successful or FAIL(-1) otherwise

**Description**

This routine writes the field metadata for a grid field not defined by the Grid API

**Example**

```c
status = HE5_GDwritefieldmeta(gridID, "ExternField", "Ydim,Xdim", HE5_HDFE_NATIVE_FLOAT);
```

**FORTRAN**

```fortran
integer function he5_gdwrmeta(gridid, fieldname, dimlist, ntype)

integer       gridid
character(*)   fieldname
character(*)   dimlist
integer        ntype
```

The equivalent **FORTRAN** code for the example above is:

```fortran
parameter (HE5_HDFE_NATIVE_FLOAT=1)

status = he5_gdwrmeta(gridid, "ExternField", "Xdim,Ydim", HE5_HDFE_NATIVE_FLOAT)
```
Write/Update Group Grid Attribute

HE5_GDwritegrpattr

herr_t HE5_GDwritegrpattr(hid_t gridID, const char *attrname, hid_t ntype, hsize_t count[], void *datbuf)

gridID IN: Grid ID returned by HE5_GDcreate or HE5_GDattach

attrname IN: Attribute name

ntype IN: Data type of attribute

count IN: Number of values to store in attribute

datbuf IN: Attribute values

Purpose Writes/Updates group attribute in a grid.

Return value Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper grid id or number type.

Description If the attribute does not exist, it is created. If it does exist, then the value(s) is (are) updated. The attribute is passed by reference rather than value in order that a single routine suffice for all numerical types. Because of this a literal numerical expression should not be used in the call. The attribute is linked to the “Data Fields” group in the swath file.

Example In this example, we write a floating point number with the name "ScalarFloat" and the value 3.14:

```c
count[0] = 1;
attr_val = 3.14;
status = HE5_GDwritegrpattr(gridid, "ScalarFloat", H5T_NATIVE_FLOAT, count, &attr_val);
```

We can update this value by simply calling the routine again with the new value:

```c
attr_val = 3.14159;
status = HE5_GDwritegrpattr(gridid, "ScalarFloat", H5T_NATIVE_FLOAT, count, &attr_val);
```
FORTRAN

integer function he5_gdwrgattr(gridid, attrname, ntype, count, datbuf)

integer         gridid
character(*)    attrname
integer         ntype
integer*4       count(*)
<valid type>    attrval(*)

The equivalent FORTRAN code for the first example above is:

parameter (HE5_HDFE_NATIVE_FLOAT=1)
attrval = 3.14
count(1) = 1
status = he5_gdwrgattr(gridid, "ScalarFloat",
HE5_HDFE_NATIVE_FLOAT,count, attrval)
Write/Update Local Grid Attribute

HE5_GDwritelocattr

herr_t HE5_GDwritelocattr(hid_t gridID, const char *fieldname, const char *attrname, hid_t ntype, hsize_t count[], void *datbuf)

gridID IN: Grid ID returned by HE5_GDcreate or HE5_GDattach
fieldname IN: Field name
attrname IN: Attribute name
ntype IN: Data type of attribute
count IN: Number of values to store in attribute
datbuf IN: Attribute values

Purpose Writes/Updates group attribute in a grid.

Return value Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper grid id or number type.

Description If the attribute does not exist, it is created. If it does exist, then the value(s) is (are) updated. The attribute is passed by reference rather than value in order that a single routine suffice for all numerical types. Because of this a literal numerical expression should not be used in the call. The attribute is linked to a particular “Data Field” in the grid file.

Example In this example, we write a floating point number with the name "ScalarFloat" and the value 3.14:

```c
count[0] = 1;
attr_val = 3.14;
status = HE5_GDwritelocattr(gridid, "DataField", "ScalarFloat", H5T_NATIVE_FLOAT, count, &attr_val);
```

We can update this value by simply calling the routine again with the new value:

```c
attr_val = 3.14159;
status = HE5_GDwritelocattr(gridid, "DataField", "ScalarFloat", H5T_NATIVE_FLOAT, count, &attr_val);
```
FORTRAN

```fortran
integer function he5_gdwrlattr(gridid, fieldname, attrname, ntype, count, datbuf)

integer       gridid
character(*)   fieldname
character(*)   attrname
integer*4     count(*)
<valid type>   attrval(*)

The equivalent FORTRAN code for the first example above is:

parameter (HE5_HDFE_NATIVE_FLOAT=1)
attrval  = 3.14
count(1) = 1
status = he5_gdwrlattr(gridid, "DataField", "ScalarFloat", HE5_HDFE_NATIVE_FLOAT, count, attrval)
```
2.1.4 HDF-EOS Utility Routines

This section contains an alphabetical list of the utility functions. The functions are alphabetized on their C-language names.
HE5_EHconvAng

double HE5_EHconvAng(double inAngle, int code)

inAngle IN: Input angle

code IN: Conversion code

Purpose Convert among various angular units.

Return value Returns angle in desired units if successful or FAIL (-1) otherwise.

Description This routine converts angles between three units, decimal degrees, radians, and packed degrees-minutes-seconds. In the later unit, an angle is expressed as an integral number of degrees and minutes and a floating point value of seconds packed as a single double number as follows:

DDDMMSSS.SS. The six conversion codes are:

HE5_HDFE_RAD_DEG (0), HE5_HDFE_DEG_RAD (1),
HE5_HDFE_DMS_DEG (2), HE5_HDFE_DEG_DMS (3),
HE5_HDFE_RAD_DMS (0), and HE5_HDFE_DMS_RAD (1), where
the first three letter code (RAD - radians, DEG - decimal degrees, DMS - packed degrees-minutes-seconds) corresponds to the input angle and the second to the desired output angular unit.

Example To convert 27.5 degrees to packed format:

inAng = 27.5;
outAng = HE5_EHconvAng(inAng, HDFE_DEG_DMS);

“outAng” will contain the value: 27030000.00.

FORTRAN real*8 function he5_ehconvang(inangle,code)
real*8 inangle
integer code

The equivalent FORTRAN code for the example above is:

inangle = 27.5
code = 3
outangle = he5_ehconvang(inangle, code)
Get HDF-EOS Version String

HE5_EHgetversion

herr_t HE5_EHgetversion(hid_t fid, char *version)

**Purpose**
Get HDF-EOS version string.

**Return value**
Returns SUCCEED(0) if successful or FAIL(-1) otherwise.

**Description**
This routine returns the HDF-EOS version string of an HDF-EOS file. This designates the version of HDF-EOS that was used to create the file. This string is of the form: “HDFEOS_Vmaj.min” where maj is the major version and min is the minor version.

**Example**
To get the HDF-EOS version (assumed to be 5.1.2) used to create the HDF-EOS file: “Swath.he5”:

```c
char version[16];

fid = HE5_SWopen("Swath.he5", H5F_ACC_RDONLY);
status = HE5_EHgetversion(fid, version);
“version” will contain the string: “HDFEOS_5.1.2”.
```

**FORTRAN**
integer function he5_ehgetver(fid,version)

```fortran
integer(fid
character(*) version

integer HE5_HDFE_RDONLY = 1
parameter (HE5_HDFE_RDONLY=1)
```
The equivalent **FORTRAN** code for the example above is:

```fortran
character*16 version

fid = he5_swopen("Swath.he5",HE5_HDFE_RDONLY)
status = he5_ehgetver(fid, version)
```
Return Information about Global File Attribute

HE5_EHglbattrinfo

herr_t HE5_EHglbattrinfo(hid_t fileID, const char *attrname, H5T_class_t *ntype, hsize_t *count)

fileID IN: HDF-EOS file ID returned by HE5_SWopen/HE5_GDopen/HE5_PTopen
attrname IN: Attribute name
numbertype OUT: Data type class ID of attribute
count OUT: Number of attribute elements

Purpose Returns information about Global File attribute
Return value Returns SUCCEED (0) if successful or FAIL (-1) otherwise.
Description This routine returns number type and number of elements (count) of Global File attribute.
Example In this example, we return information about the FloatAttr attribute.

status = HE5_EHglbattrinfo(fileID, "FloatAttr", &nt, &count);

The nt variable will have the value 1 and count will have the value 1.

FORTRAN integer function he5_ehglatinf(fileid, attrname, ntype, count,)
integer fileid
character*(*) attrname
integer ntype
integer *4 count

The equivalent FORTRAN code for the first example above is:

status = he5_ehglatinf(fileid, "FloatAttr", nt, count)
Get HDF-EOS File IDs

HE5_EHidinfo

herr_t HE5_EHidinfo(hid_t fid, hid_t *HDFfid, hid_t *gid)

fid IN: File ID returned by HE5_SWopen, HE5_GDopen, or HE5_PTopen.

HDFfid OUT: HDF-EOS file ID (returned by HE5_EHopen)

gid OUT: "HDFEOS" group ID

Purpose Get HDF-EOS file IDs.

Return value Returns SUCCEED(0) if successful or FAIL(-1) otherwise.

Description This is a wrapper around HE5_EHchkfid () and it returns the HDF file IDs to the HDF-EOS file ID returned by HE5_SWopen, HE5_GDopen, or HE5_PTopen. These ids can then be used to create or access HDF5 structures such as groups, attributes, datasets within an HDF-EOS file.
Retrieve Information about Global File Attributes

**HE5_EHinqglbattrs**

```c
long HE5_EHinqglbattrs(hid_t fileID, char *attrnames, long *strbufsize)
```

- **fileID**
  - IN: HDF-EOS file ID returned by HE5_SWopen/HE5_GDopen/HE5_PTopen

- **attrnames**
  - OUT: Attribute list (entries separated by commas)

- **strbufsize**
  - OUT: String length of attribute list

**Purpose**
Retrieve information about Global attributes defined in file.

**Return value**
Number of attributes found if successful or FAIL (-1) otherwise.

**Description**
The attribute list is returned as a string with each group attribute name separated by commas. If `attrlist` is set to NULL, then the routine will return just the string buffer size, `strbufsize`. This variable does not count the null string terminator.

**Example**
In this example, we retrieve information about the Global attributes defined for the “swath.he5” file (with the file ID `fileID`). We assume that there are two attributes stored, `GlobAttr_1` and `GlobAttr_2`:

```c
nattr = HE5_EHinqglbattrs(fileID, NULL, &strbufsize);
```

The parameter, `nattr`, will have the value 2 and `strbufsize` will have value 21.

```c
nattr = HE5_EHinqglbattrs(fileID, attrnames, &strbufsize);
```

The variable, `attrnames`, will be set to:

"GlobAttr_1,GlobAttr_2".

**FORTRAN**

```fortran
integer*4 function he5_ehinqglatts(fileid, attrnames, strbufsize)

integer       fileid
character(*)   attrnames
integer*4     strbufsize
integer*4     nattr

The equivalent FORTRAN code for the example above is:

nattr = he5_ehinqglatts(fileid, attrnames, strbufsize)
```

2-224 175-TP-511-003
# Read Global File Attribute

**HE5_EHreadglbattr**

```
he5_ehrdglatt(fileid, attrname, datbuf)
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fileid</td>
<td>HDF-EOS file ID returned by HE5_SWopen/HE5_GDopen/HE5_PTopen</td>
</tr>
<tr>
<td>attrname</td>
<td>Attribute name</td>
</tr>
<tr>
<td>datbuf</td>
<td>Buffer allocated to hold attribute values</td>
</tr>
</tbody>
</table>

**Purpose**

Reads global attribute from a file.

**Return value**

Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper file ID or number type or incorrect attribute name.

**Description**

The attribute is passed by reference rather than value in order that a single routine suffice for all numerical types.

**Example**

In this example, we read a floating point attribute with the name "FloatAttr":

```
status = HE5_EHreadglbattr(fileID, "FloatAttr", &data);
```

The equivalent FORTRAN code for the example above is:

```
integer function he5_ehrdglatt(fileid, attrname, datbuf)
integer fileid
character*(*) attrname
<valid type> datbuf(*)
```

```
status = he5_ehrdglatt(fileid, "FloatAttr", datbuf)
```
Write/Update Global File Attribute

**HE5_EHwriteglbattr**

```c
herr_t HE5_EHwriteglbattr(hid_t fileID, const char *attrname, hid_t ntype,
                           hsize_t count[], void *datbuf)
```

- **fileID** IN: HDF-EOS file ID returned by HE5_SWopen/HE5_GDopen/HE5_PTopen
- **attrname** IN: Attribute name
- **ntype** IN: Data type of attribute
- **count** IN: Number of values to store in attribute
- **datbuf** IN: Attribute values

**Purpose** Writes/Updates Global attribute in HDF-EOS file.

**Return value** Returns SUCCEED (0) if successful or FAIL (-1) otherwise. Typical reasons for failure are an improper file ID or number type.

**Description** If the attribute does not exist, it is created. If it does exist, then the value(s) is (are) updated. The attribute is passed by reference rather than value in order that a single routine suffice for all numerical types. Because of this a literal numerical expression should not be used in the call. The attribute is linked to the “ADDITIONAL/FILE ATTRIBUTES” group in the HDF-EOS file.

**Example** In this example, we write a single precision (32 bit) floating point number with the name "FloatAttr" and the value 3.14:

```c
count[0] = 1;
attr_val = 3.14;
status = HE5_EHwriteglbattr(fileid, "FloatAttr",
                           H5T_NATIVE_FLOAT, count, &attr_val);
```

We can update this value by simply calling the routine again with the new value:

```c
attr_val = 3.14159;
status = HE5_EHwriteglbattr(fileid, "FloatAttr",
                           H5T_NATIVE_FLOAT, count, &attr_val);
```
FORTRAN  integer function he5_ehwrglbattr(fid,attrname,ntype,count,buffer)
integerfid,status,ntype
character *(*)attrname
integer*4 count
<valid type> buffer(*)
integerHE5_HDFE_NATIVE_FLOAT
parameter(HE5_HDFE_NATIVE_FLOAT=1)
The equivalent FORTRAN code for the example above is:

count = 1
status = he5_ptwrqlbattr(fid, "FloatAttr", HE5_HDFE_NATIVE_FLOAT, count, buffer)
